# STRUCTURAL STABILITY ASSESSMENT OF EXISTING CHANDERKUNJ ARMY RESIDENTIAL TOWER-C OF ARMY WELFARE HOUSING ORGANIZATION (AWHO) AT SILVER SAND ISLAND, VYTILLA, KOCHI, KERALA

## APRIL - 2023

## ACKNOWLEDGEMENT

We are thankful to the concerned authorities of M/s Army Welfare Housing Organization, Kochi, for their kind co-operation during the assessment. We appreciate the courtesy & support extended to the Bureau Veritas auditors.

- Bureau Veritas (India) Pvt. Ltd.

## DISCLAIMER

This report includes the findings of the Site inspections carried out at Chanderkunj Army Residential towers at Vytilla, Cochin. This report is issued strictly in accordance with the scope of contract, documents submitted and does not perpetuate into compliance to any statutory regulations and / or codes of any country or authority or region. The discussion of facts, as determined by the investigator, and the views expressed in the report do not assume and are not intended to establish the existence of any duty at law on the part of M/s Army Welfare Housing Organization/residents welfare association of Chanderkunj Army Towers, their employees or agents, contractors or any other party. *This report neither determines nor implies liability.* All the information provided in this report is based on the condition of site as on the date of audit/inspection and the information and access provided to the inspector. This report is only a third-party observation and is not a certificate of any assurance to any party regarding the future condition of the site. Under no circumstances shall Bureau Veritas India Pvt Ltd, it's employees or the inspector shall be in any way responsible or liable for any accidents, incidents, damage to life, property or any other legal issue arising out of the site mentioned in this report directly or indirectly." Neither Bureau Veritas nor any of its agents warrant the quality, outcome, effectiveness or appropriateness of any decision or action undertaken on the basis of this report. The report does not absolve M/s Army Welfare Housing Organization/residents welfare association of Chanderkunj Army Towers or any other party from any responsibility or their contractual liability to the residents.

# 1. INTRODUCTION

The existing **"Chanderkunj Army Residential Towers"** located at Silver Sand Island, Vytilla, Kochi, Kerala is a conventional RC framed structure with infilled masonry walls. The residential complex consists of three towers namely A, B, C and Club House.

**Tower A :** comprises of ground plus fourteen upper floors.
**Tower B :** comprises of common basement, ground floor plus twenty-seven upper floors with Helipad in Terrace.
**Tower C :** comprises of common basement, ground floor plus twenty-seven upper floors with Helipad in Terrace.
**Club House :** consists of ground plus one upper floor.
These residential blocks were reported to be constructed about 6 years back and since then most of the flats were occupied.

Off late, in continuation to previous evaluation of partial structure carried out by M/s. BVIPL and structural peer review by Govt Engineering College, Thiruvananthapuram the concerned authorities of **M/s Army Welfare Housing Organisation (AWHO)** and **Residential Welfare Association (RWA) of Chanderkunj Army Residential Towers** wanted to assess the structural stability and residual life of Tower -C and Tower -B structures in totality in view of distress features observed such as Cracks, spalling of cover concrete, exposure of rebars in RC members & continuous leakage/seepage of water from RC retaining wall & slab, dampness/damp patches, peeling of paint were observed in RC members in the Tower B & C.
Hence, a reference was made to M/s Bureau Veritas India Pvt. Ltd, to assess structural stability of Tower B & C structures in totality from basement to terrace including Helipad and to suggest appropriate restoration /corrective measures to enhance the longevity of the structure.

In response to this, a detailed investigative study was carried out by M/s Bureau Veritas India Pvt. Ltd. from **18th January 2023** and **24th February 2023** by conducting the visual inspection, Drone survey, Non-destructive tests, lab tests to assess the quality/strength of concrete in RC members & laboratory tests to assess the Core Compressive Strength, Chloride content, Sulphate content & pH level in concrete samples. Based on the results of

various tests mentioned above a detailed theoretical verification and design check was carried out to analyze the structural adequacy with respect to distress/deficiency noticed in the structure. This report, in brief, summarizes the outcome of the visual inspection, drone survey, Non-destructive test results, lab test results, theoretical analysis and recommendations made for common basement and Tower-C in order to enhance the longevity of the structure.

## 2. BACKGROUND OF PROJECT

In view of distress features observed such as Cracks, spalling of cover concrete, exposure of rebars in RC members & continuous leakage/seepage of water from RC retaining wall & slab, dampness/damp patches, peeling of paint were observed in RC members in the Tower B & C based on the requirement of SIPL/AWHO/RWA soundness assessment of common basement of tower-B& C and terrace floors were investigated by M/s. Bureau Veritas India Pvt Ltd, Cochin and report was submitted during 2021.

Using the observations, non destructive test results and lab results of the study report submitted by BVIPL during 2021, AWHO appointed Government Engineering College, Barton Hill, Thiruvananthapuram (GEC) to study the status of the tower B& C and to carry out the analysis of the these towers to understand the deficiency in the structure and to propose the retrofitting methods, if required. As per the information gathered and details furnished, GEC has done the physical observations of these towers, prepared design basis report, ETABS Model based on the drawings supplied to them. Using the Condition Assessment of tower B & C furnished by B, GEC furnished the details of adequacy evaluation of columns, shear walls of the tower C in terms of Demand /Capacity to carry the gravitational load (DL & LL) and lateral loads, and proposed the retrofitting scheme for the distressed elements of these towers. Adequacy of Foundation, Retaining Walls and Slab and Beams details are not furnished.

AWHO appointed Bureau Veritas for reviewing the Structural Assessment of the tower B & C and strengthening schemes proposed by the GEC. The scope of work of BV is limited to review of the Structural Assessment of Tower B & C and the Structural Assessment methodology adopted by GEC. To provide BOQ for the retrofitting works and propose three (3Nos) contractors for retrofitting works.

There was no binding for BV in deciding the retrofitting contractors and it is sole responsibility of AWHO. Structural Peer Review and findings on Structural Assessment of Tower C and strengthening of distress members were presented to AWHO with recommendation. GEC provided the capacity and demand of columns and Shear walls for few floors only for the distress condition and **there is no information provided on horizontal floor plate structural components such as beams & slabs, also foundation and retaining walls of tower C.**

In the review report on Structural Assessment done by GEC and BV recommended that the entire building to be reassessed in view of the time lapses from the condition assessment and strengthening shall not be limited to only two floors i.e., for Basement & Ground Floor.

AWHO appointed BV to reassess the entire building health condition and propose strengthening of structural components appropriately to enhance the life and predict the residual life.

## 3. SCOPE OF WORK AND EXCLUSION

### 3.1 PART A: VISUAL INSPECTION

1) Visual inspection to assess the condition of the structure. All the structural elements above the basement level, at least 70% of the elements to be inspected based on site situation
2) Identifying any signs of structural distress and deformation, any signs of material deterioration.
3) Preparation of visual inspection report along with observation, photographs and propose the NDT test plan for of distressed members for further evaluation.

### 3.2 PART B: NDT TEST

**Tests on RC members/Concrete:**

1) Dimensional verification of the existing structural members with existing asbuilt drawings for theoretical verification.
2) Carrying out Ultrasonic Pulse Velocity Test on distressed and all accessible RC members at all floors for assessment of quality/in-situ strength of concrete as per **IS 516 Part 5/Sec-1:2018.**
3) Carrying out Rebound Hammer Test on distressed and all accessible RC members at all floors for assessment of surface hardness and strength of concrete as per **IS 516 Part 5/Sec-4:2020.**

4) Carrying out Cover meter Test on distressed and all accessible RC members at all floors for detecting disposition of re-bars and thickness of cover concrete provided as **IS 1881Part 204:1988.**

5) Carrying out Half-Cell Potential measurement test on distressed and identified RC members to assess the extent of corrosion & mapping of corrosion as per **IS 516 Part 5/Sec-2:2021.**

6) Carrying out carbonation test on randomly identified RC members to assess the depth of carbonation in cover concrete as per **IS 516 Part 5/Sec-3:2021.**

7) Carrying out chemical analysis of concrete for assessment of chloride content as per IS: 14959 part II-2001, Sulphate Content as per **BS: 1881 (Part 124) – 2015 a**nd pH value as per **IS: 2720 (Part 26): 1987 (RA 2021)** of concrete through samples collected at site.

8) Carrying out electrical resistivity test (resipod test) on RC members to estimate the likelihood of corrosion

***NDT on RC structural elements will be done with random sampling covering Columns, Shear walls, Beams and slabs. The structural members NDT location shall be decided based on visual inspections.***

## 3.3 PART C: THEORETICAL VERIFICATION AND DESIGN CHECK

Theoretical Evaluation and Structural Assessment for Tower B & C, Tower A is not included in the scope of work. As reported by AWHO team building was constructed and completed in the year 2016. The design of the building shall comply with prevailing IS codes during construction of the building, IS codes to be followed in Structural Assessment of Tower B & Tower C are listed in next class.

**REFERENCE CODES & STANDARDS**

a) **IS 456: 2000** – Code of Practice for Plain & Reinforced Concrete

b) **IS 875: Part 1: 1987** – Code of practice for design loads (Other than Earthquake) for buildings & Structures

c) **IS 875: Part 2: 1987** – Code of practice for design loads (Other than Earthquake) for buildings & Structures

d) **IS 875: Part 3: 2015** – Code of practice for design loads (Other than Earthquake) for buildings & Structures

e) **IS 1893: Part 1– 2002** Criteria for Earthquake Resistant Design of Structures.

f) **IS 13920: 1993 –** Code of Practice for Ductile Design & Detailing of Reinforced Concrete Structures Subjected to Seismic Forces

g) Strengthening Codes & Literature.

h) Nondestructive Test Codes

1) Carrying out three-dimensional analysis of the structural system of the structure using appropriate analysis and software- ETABS

2) Carrying out theoretical analysis & design check of the members for critical load combinations present loading & compliance with prevailing seismic conditions.

a) Evaluation of Foundation

b) Evaluation of Columns & Shear Walls-All Floors

c) Evaluation of Slabs of Floors (Random sampling)

d) Evaluation of Beams for Floors (Random sampling)

e) Evaluation of Staircase

**Details required for AWHO**

The following soft copy and hardcopies are required from AWHO for Tower B & C

1. Survey Report of the area
2. Soil Test Report
3. Final Architectural Drawings
4. Final Structural Framing Drawings / GA drawings
5. Structural Drawings – Reinforcement Drawings of Structural components
   a) Pile layout and details
   b) Pile cap details
   c) Plinth Beam Details
   d) Column & Shear Walls
   e) Slabs and Beams Reinforcement details all floors
   f) Staircase Details

## 3.4 PART D: RESTORATION MEASURES.

a) Suggesting appropriate restoration measures for repairs and rehabilitation works based on NDT results and Theoretical Analysis and Design Check.

b) Scheme and Sketches for Repairs & Rehabilitation.

### 3.5 PART E: PREPARATION OF TENTATIVE COST ESTIMATE (BOQ)

Based on the proposed repairs and restoration measures, preparation of bill of quantities for material and labour component for proposed repair/strengthening work. The BOQ may vary +/- 15 % by quantity as per site condition and will be as per prevailing market rates Suggestion of Material Specifications for the repairs and rehabilitation works.

### 3.6 EXCLUSION

a) Evaluation of MEP service
b) Evaluation of Finishes and other
c) Execution/ supervision of strengthening works

## 4.0 PHYSICAL OBSERVATIONS

Following are the physical observations made consequent to the detailed inspection of Common Basement and Tower C.

***COMMON BASEMENT FLOOR (TOWER B AND C):***

a) No visible signs of settlement in the foundation system were observed in any part of the structure.
b) Severe leakage/dampness was observed in the peripheral retaining wall at isolated locations. Further, these leakage regions were observed to be treated by the grouting technique. Despite this, leakages are persisting in these locations.
c) Cracks were observed in RC columns, beams & corbel/bracket at few locations.
d) Cracks were observed in RC beams at the duct region at most of the locations.
e) Cracks were observed along the construction joint in the ceiling slab at few locations.
f) Leakages were observed from leaky sanitary pipelines leads to splashing of water on RC column surface & stagnation close to the column at floor level.
g) Patch-up repair works were observed in RC columns, beams & ceiling slab panels at few locations.
h) Peeling of paint & dampness/damp patches were observed in the RC ceiling slab panels at few locations.

Pressure grouting treatment was observed to be carried out in RC slab panels to arrest the leakage at many locations.

i) Surface drainage system connected with a network of pipelines (embedded in the floor concrete) to a common sump to drive out seepage water from floor slab was observed in basement floor.

**(Refer General Layout Sketch DWG.REF. No.GL/BF/TC-01 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM-BF-01, NO.DM.BFa-01)**

***LIFT OF TOWER- C: BASEMENT FLOOR***

**Lift No. 01:** Minor cracks and debond of plaster were observed at few locations.

**Lift No. 02:** Minor cracks and debond of plaster were observed at few locations.

**Lift No. 03:** Minor to moderate cracks and debond of plaster were observed at few locations.

**Lift No. 04:** Moderate cracks and debond of plaster were observed at few locations.

**Lift No. 05:** Minor cracks and debond of plaster were observed at isolated location.

***LIFT OF TOWER- B: BASEMENT FLOOR***

**Lift No. 01:** Minor cracks and debond of plaster were observed at few locations.

**Lift No. 02:** Minor cracks and debond of plaster were observed at few locations.

**Lift No. 03:** Minor to moderate cracks and debond of plaster were observed at few locations.

**Lift No. 04:** Moderate cracks and debond of plaster were observed at few locations.

**Lift No. 05:** Minor cracks and debond of plaster were observed at isolated location.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/BF/TC -01)**

***GROUND FLOOR:***

- Cracks were observed in RC columns, beams, ceiling slab and staircase waist slab at most of the locations.
- Cracks in masonry wall were observed at isolated locations.
- cracks were observed at the junction of RC members and masonry walls at isolated locations.
- Patch-up repair works were observed on RC columns, beams, ceiling slab & masonry walls at few locations.
- Peeling of paint & dampness/damp patches were observed in the RC ceiling slab and beams at few locations.

- Popping up of marble flooring were observed at most of the locations.

  Debond of granite cladding around lift shear wall was observed at few locations.

  **(Refer General Layout Sketch DWG.REF. No.GL-GF-02 and**

  **Refer Distress Mapping Sketch DWG.REF. No.DM-GF-TC-02)**

  **Lift No. 01:** Minor cracks and debond of plaster were observed at isolated location.

  **Lift No. 02:** Moderate cracks and debond of plaster were observed at few locations.

  **Lift No. 03:** Moderate cracks and debond of plaster were observed at isolated locations.

  **Lift No. 04:** Minor to moderate cracks and debond of plaster were observed at few locations.

  **Lift No. 05:** Minor to moderate cracks and debond of plaster were observed at few locations.

  **(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/GF/TC -02)**

***FIRST FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flats of C-0101 & C-0104.
- Patch-up repair works were observed in staircase RC waist slab at few locations.
- Cracks in masonry wall were observed at isolated locations.
- cracks were observed at the junction of RC members and masonry walls at isolated locations.
- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.
- Peeling of paint & dampness/damp patches were observed in the RC ceiling slab at isolated locations.

  **(Refer General Layout Sketch DWG.REF. No.GL/1F/TC/03 and**

  **Refer Distress Mapping Sketch DWG.REF. No.DM/1F/TC-03)**

**Lift No. 01:** Minor to moderate cracks and debond of plaster were observed at few locations.

**Lift No. 02:** Minor cracks and debond of plaster were observed at few locations.

**Lift No. 03:** Minor cracks and debond of plaster were observed at few locations.

**Lift No. 04:** Minor to moderate cracks and debond of plaster were observed at few locations.

**Lift No. 05:** Minor to moderate cracks and debond of plaster were observed at few locations.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/1F/TC -03)**

***SECOND FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flats of C-0201, C-0202, C-0203 & C-0204.
- Patch-up repair works were observed in staircase RC waist slab at few locations.
- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.

  Peeling of paint & dampness/damp patches were observed in the RC Column at isolated locations.

**(Refer General Layout Sketch DWG.REF. No.GL/2F/TC-04 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM/2F/TC-04)**

**Lift No. 01:** Minor to moderate cracks and debond of plaster were observed at few locations.

**Lift No. 02:** Minor to moderate cracks and debond of plaster were observed at few locations.

**Lift No. 03:** Minor to major cracks and debond of plaster were observed at isolated locations.

**Lift No. 04:** Minor cracks and debond of plaster were observed at few locations.

**Lift No. 05:** Minor to major cracks and debond of plaster were observed at isolated locations.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/2F/TC -04)**

***THIRD FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flats of C-0301, C-0302, C-0303 & C-0304.
- Cracks in masonry wall were observed at isolated locations.
- Cracks were observed at the junction of RC members and masonry walls at isolated locations.
- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at isolated locations.

**(Refer General Layout Sketch DWG.REF. No.GL/3F/TC-05 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM/3F/TC-05)**

**Lift No. 01:** Minor to moderate cracks and debond of plaster were observed at isolated locations.
**Lift No. 02:** Moderate to major cracks and debond of plaster were observed at few locations.
**Lift No. 03:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 04:** Moderate to major cracks and debond of plaster were observed at few locations.
**Lift No. 05:** Moderate cracks and debond of plaster were observed at few locations.
**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/3F/TC -05)**

***FOURTH FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flats of C-0401, C-0403 & C-0404.
- Cracks in masonry wall were observed at isolated locations.
- Cracks were observed at the junction of RC members and masonry walls at isolated locations.

- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at isolated locations.

**(Refer General Layout Sketch DWG.REF. No.GL/4F/TC-06 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM/4F/TC-06)**

**Lift No. 01:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 02:** Moderate to major cracks and debond of plaster were observed at few locations.
**Lift No. 03:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 04:** Moderate to major cracks and debond of plaster were observed at few locations.
**Lift No. 05:** Moderate cracks and debond of plaster were observed at few locations.
**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/4F/TC -06)**

***FIFTH FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flat of C-0504.
- Patch-up repair works were observed in staircase RC waist slab & chejjas at few locations.
- Cracks in masonry wall were observed at isolated locations.
- Cracks were observed at the junction of RC members and masonry walls at isolated locations.
- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.

**(Refer General Layout Sketch DWG.REF. No.GL/5F/TC-07 and**

**Lift No. 03:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 04:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 05:** Moderate cracks and debond of plaster were observed at few locations.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/5F/TC -07)**

***SIXTH FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flats of C-0601, C-0603 & C-0604.
- Patch-up repair works were observed in staircase RC waist slab at few locations.
- Cracks in masonry wall were observed at isolated locations.
- Cracks were observed at the junction of RC members and masonry walls at isolated locations.
- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at few locations.

**(Refer General Layout Sketch DWG.REF. No.GL/6F/TC-08 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM/6F/TC-08)**

**Lift No. 01:** Moderate cracks and debond of plaster were observed at few locations.

**Lift No. 02:** Minor cracks and debond of plaster were observed at few locations.

**Lift No. 03:** No distress were observed.

**Lift No. 04:** Moderate cracks and debond of plaster were observed at few locations.

**Lift No. 05:** Moderate cracks and debond of plaster were observed at few locations.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/6F/TC -08)**

***SEVENTH FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flats of C-0701 & C-0702.
- Patch-up repair works were observed in staircase RC waist slab at few locations.
- Cracks in masonry wall were observed at isolated locations.

- Cracks were observed at the junction of RC members and masonry walls at isolated locations.
- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at isolated locations.

**(Refer General Layout Sketch DWG.REF. No.GL/7F/TC-09 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM/7F/TC-09)**

**Lift No. 01:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 02:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 03:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 04:** Minor to moderate cracks and debond of plaster were observed at few locations.
**Lift No. 05:** Minor to moderate cracks and debond of plaster were observed at few locations.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/7F/TC -09)**

***EIGHTH FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flats of C-0801, C-0802, C-0803 & C-0804.
- Patch-up repair works were observed in staircase RC waist slab, chejjas & parapet wall at few locations.
- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at isolated locations.

**(Refer General Layout Sketch DWG.REF. No.GL/8F/TC-10 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM/8F/TC-10)**

**Lift No. 01:** Minor to moderate cracks and debond of plaster were observed at few locations.

**Lift No. 02:** Minor to moderate cracks and debond of plaster were observed at few locations.

**Lift No. 03:** Moderate cracks and debond of plaster were observed at few locations.

**Lift No. 04:** No distress were observed.

**Lift No. 05:** Moderate cracks and debond of plaster were observed at few locations.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/8F/TC -10)**

***NINTH FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at most of the locations.
- Popping up of granite flooring were observed at most of the locations in common area.
- Popping up of tiles were observed at most of the locations inside the flats of C-0901, C-0902, C-0903 & C-0904.
- Patch-up repair works were observed in staircase RC waist slab at few locations.
- Cracks in masonry wall were observed at isolated locations.
- Cracks were observed at the junction of RC members and masonry walls at isolated locations.
- Cracks were observed in RC columns, beams, ceiling slab, staircase waist slab & chejjas at most of the locations.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at few locations.

***TWENTIETH FLOOR:***

- Debond of granite cladding around lifts shear wall were observed isolated locations.
- Cracks were observed in RC staircase waist slab at isolated location.
- Cracks in masonry wall were observed at isolated locations.
- Cracks were observed at the junction of RC members and masonry walls at isolated locations.
- Any other major distress features were not observed other than the above mention distress in this floor.
- Flat No. C-2004 was not inspected due to non-availability of the occupant.

  **(Refer General Layout Sketch DWG.REF. No.GL/20F/TC-22 and**
  **Refer Distress Mapping Sketch DWG.REF. No.DM/20F/TC-22)**

**Lift No. 01:** No distress were observed.
**Lift No. 02:** No distress were observed.
**Lift No. 03:** Moderate cracks and debond of plaster were observed at isolated location.
**Lift No. 04:** Moderate cracks and debond of plaster were observed at few locations.
**Lift No. 05:** Moderate cracks and debond of plaster were observed at isolated location.
**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/20F/TC -22)**

***TWENTY FIRST FLOOR:***

- Popping up of tiles were observed at isolated location inside the flat of C-2101.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at isolated locations.
- Any other major distress features were not observed other than the above mention distress in this floor.
- Flat No. C-2104 was not inspected due to non-availability of the occupant.

  **(Refer General Layout Sketch DWG.REF. No.GL/21F/TC-23and**
  **Refer Distress Mapping Sketch DWG.REF. No.DM/21F/TC-23)**

**Lift No. 01:** No distress were observed.
**Lift No. 02:** Moderate cracks and debond of plaster were observed at isolated location.
**Lift No. 03:** No distress were observed.
**Lift No. 04:** No distress were observed.

**Lift No. 05:** Moderate cracks and debond of plaster were observed at isolated location.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/21F/TC -23)**

***TWENTY SECOND FLOOR:***

- Debond of granite cladding around lifts shear wall were observed at isolated location.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at isolated location.
- Any other major distress features were not observed other than the above mention distress in this floor.

**(Refer General Layout Sketch DWG.REF. No.GL/22F/TC-24 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM/22F/TC-24)**

**Lift No. 01:** No distress were observed.

**Lift No. 02:** No distress were observed.

**Lift No. 03:** No distress were observed.

**Lift No. 04:** No distress were observed.

**Lift No. 05:** No distress were observed.

***TWENTY THIRD FLOOR:***

- Cracks in masonry wall & separation cracks were observed at isolated location inside the flat of C-2301.
- Cracks were observed in RC staircase waist slab at isolated location.
- Any other major distress features were not observed other than the above mention distress in this floor.

**(Refer General Layout Sketch DWG.REF. No.GL/23F/TC-25 and**
**Refer Distress Mapping Sketch DWG.REF. No.DM/23F/TC-25)**

**Lift No. 01:** No distress were observed.

**Lift No. 02:** No distress were observed.

**Lift No. 03:** Minor to moderate cracks and debond of plaster were observed at isolated location.

**Lift No. 04:** No distress were observed.

**Lift No. 05:** No distress were observed.

**(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/23F/TC -25)**

***TWENTY FOURTH FLOOR:***

No major distress features were observed in this floor.

**(Refer General Layout Sketch DWG.REF. No.GL/24F/TC-26 and Refer Distress Mapping Sketch DWG.REF. No.DM/24F/TC-26)**

**Lift No. 01:** No distress were observed.
**Lift No. 02:** No distress were observed.
**Lift No. 03:** No distress were observed.
**Lift No. 04:** No distress were observed.
**Lift No. 05:** No distress were observed.

***TWENTY FIFTH FLOOR:***

- Peeling of paint & dampness/damp patches were observed in the masonry wall at isolated locations inside the flat of C-2503.
- Any other major distress features were not observed other than the above mention distress in this floor.

**(Refer General Layout Sketch DWG.REF. No.GL/24F/TC-26 and Refer Distress Mapping Sketch DWG.REF. No.DM/24F/TC-26)**

**Lift No. 01:** No distress were observed.
**Lift No. 02:** No distress were observed.
**Lift No. 03:** No distress were observed.
**Lift No. 04:** No distress were observed.
**Lift No. 05:** No distress were observed.

***TWENTY SIXTH FLOOR:***

- Patch-up repair works were observed in staircase RC waist slab at few locations.
- Cracks in masonry wall & separation cracks were observed at few locations inside the flats of C-2601, C-2602, C-2603 & C-2604.
- Peeling of paint & dampness/damp patches were observed in the masonry wall at few locations.

- Any other major distress features were not observed other than the above mention distress in this floor.

  **(Refer General Layout Sketch DWG.REF. No.GL/26F/TC-28 and Refer Distress Mapping Sketch DWG.REF. No.DM/26F/TC-28)**

  **Lift No. 01:** No distress were observed.
  **Lift No. 02:** No distress were observed.
  **Lift No. 03:** No distress were observed.
  **Lift No. 04:** No distress were observed.
  **Lift No. 05:** Minor cracks and debond of plaster were observed at isolated location.
  **(Refer Distress Mapping Sketch DWG.REF. No.DM/LW/26F/TC -25)**

***TWENTY SEVENTH FLOOR AND HELIPAD:***

- Peeling of paint & condensation stains were observed in the RC members at few locations.
- Any other major distress features were not observed other than the above mention distress in this floors.

  **(Refer General Layout Sketch DWG.REF. No.GL/27F/TC-29 and Refer Distress Mapping Sketch DWG.REF. No.DM/2F/TC-29)**

**Refer DWG.REF. No.DM/EL/TC-01 TO 04 for distress mapping of external surfaces of tower**

## 5.0 PROBING TESTS.

In order to assess the extent of distress & to assess the quality/strength of concrete in RC members of Tower – C following probing tests/studies were resorted to.

**5.1 Preparation of distress mapping sketches by visual inspection and Drone Survey.**

**5.2 Non-destructive Ultrasonic Pulse Velocity quality and integrity of concrete in RC members.**

**5.3 Non-destructive Rebound Hammer test to assess the surface hardness of concrete nearer to the surface in RC members**

**5.4 Cover meter studies to measure the thickness of cover concrete.**

**5.5 Semi-Destructive test to assess the strength of concrete in RC Columns, Beams &Slab.**

**5.6 Half-cell potential measurement test on RC members to assess the probability of**

**corrosion.**

**5.7 Carbonation test on RC members to assess the loss of alkalinity in concrete.**

**5.8 Chemical Analysis on concrete samples to assess.**

**a. Chloride content**

**b. Sulphate content**

**5.9 Chemical Analysis on concrete samples for determination of pH value.**

**5.10 Electrical Resistivity of Concrete using Resipod to determine the likelihood of corrosion.**

**5.11 Infrared Thermography on distressed regions to assess the extent and source of dampness in RC members.**

**5.12 Test on water sample.**

**Note:**

**a.** Three Bore-Hole Points were reported with in the premises of the apartment. At present all were reported to be closed/not in use. Since the bore wells not in operation water couldn't be collected and tested.

**b.** The water surrounding/vicinity of apartment is reported to be a sea back water. Hence chloride content test from this source was not found necessary.

**c.** Attempt to evaluate the strength/quality of pile and pile caps were made, but due to presence of high-water table evaluation below couldn't be carried out. During the process of evaluation water started oozing out from the floor slab. Oozed out water from the flooring was collected and subjected to test to understand the impact of water on the pile foundation.

**5.1 Preparation of layouts for distress mapping sketches by visual inspection and Drone Survey.**

A detailed visual inspection of the entire structure was carried out to map the distress in the existing structural and non-structural members of the building.

Drone survey was carried out to on the external surface of the building to view the manually inaccessible distressed regions. By verify the drone videos on all four sides of the structure the distress mapping on elevation sketches has been carried out.

The distress mapping sketches has been appended in the Annexure and videos of the drone survey is also appended as a DVD enclosure.

## 5.2 Non-destructive Ultrasonic Pulse Velocity quality and integrity of concrete in RC members.

Ultrasonic Pulse Velocity test was conducted on RC members at random to assess the quality and integrity of concrete in RC members of Tower C and common basements. The test was conducted using "PUNDIT Lab+" (Portable Ultrasonic Non-destructive Digital Indicating Tester) equipment from M/s. Proceq, Switzerland as per the guidelines in Indian Standard **IS: 516(Part-5/Sec1)-2018 (Amendment –November 2019).** Direct & Indirect method of test was adopted at the site for scanning. The results of the test are tabulated in **Test Report and the corresponding quality grading chart has been appended for reference.**

The Ultrasonic Pulse Velocity Floor/member-wise test results indicate that the quality of concrete in the tested RC members **as per clause 2.5.2 of IS: 516(Part 5/Sec1)-2018 (Amendment – November 2019)** are found to be as follows :

***COMMON BASEMENT FLOOR – TOWER-B AND C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Doubtful to Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.
- RC Corbels fall fall under the category of **"Doubtful to Good"** concrete.

***GROUND FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***FIRST FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***SECOND FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Doubtful to Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***THIRD FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***FOURTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***FIFTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***SIXTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful"** concrete
- RC Beams fall under the category of **"Doubtful"** concrete.
- RC Slab fall under the category of **"Doubtful to Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***SEVENTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful"** concrete.
- RC Slab fall under the category of **"Doubtful to Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***EIGHTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Doubtful to Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***NINTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful"** concrete.
- RC Slab fall under the category of **"Doubtful to Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***TENTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful"** concrete.
- RC Slab fall under the category of **"Doubtful to Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***ELEVENTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***TWENTY SECOND FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***TWENTY THIRD FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***TWENTY FOURTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***TWENTY FIFTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

***TWENTY SIXTH FLOOR – TOWER-C***

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Good"** concrete.
- RC Shear Wall fall under the category of **"Doubtful to Good"** concrete.

**TWENTY SEVENTH & HELIPAD FLOOR – TOWER-C**

- RC Columns fall under the category of **"Doubtful to Good"** concrete
- RC Beams fall under the category of **"Doubtful to Good"** concrete.
- RC Slab fall under the category of **"Doubtful to Good"** concrete.

### 5.3 Non-destructive Rebound Hammer test to assess the surface hardness of concrete nearer to the surface in RC members

Rebound Hammer Test was carried out on RC slab and shear wall of common basement floor of Tower B & C and all floor slabs of Tower-C at random to assess the surface hardness/strength of concrete nearer to surface. The test was conducted using Schmidt Rebound Hammer from M/s. Proceq, Switzerland as per the guidelines in Indian Standard IS: 516 (Part5/Sec4)-2020. The position of the hammer was vertically upwards during the test. The results of the test are tabulated in **Test Report and the corresponding reference strength chart has appended.**

From the results of the Rebound Hammer test, it is indicated that the estimated compressive strength of concrete nearer to surface in the tested RC slabs and shear walls is found to be as detailed below.

***COMMON BASEMENT FLOOR – TOWER-B AND C***

RC Slab – Found to be in the range of **22 N/mm$^2$** to **34 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **26 N/mm$^2$.**

***GROUND FLOOR – TOWER-C***

RC Slab – Found to be in the range of **18 N/mm$^2$** to **28 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***FIRST FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **30 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***SECOND FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **30 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***THIRD FLOOR – TOWER-C***

RC Slab – Found to be in the range of **26 N/mm$^2$** to **30 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***FOURTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **26 N/mm$^2$** to **30 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***FIFTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **28 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **16 N/mm$^2$.**

***SIXTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **22 N/mm$^2$** to **34 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***SEVENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **26 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***EIGHTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **22 N/mm$^2$** to **28 N/mm$^2$.**

RC Shear Wall – Found to be **10 N/mm$^2$.**

***NINTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **22 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

**TENTH FLOOR – TOWER-C**

RC Slab – Found to be in the range of **26 N/mm$^2$** to **28 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***ELEVENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **22 N/mm$^2$** to **30 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***TWELFTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **22 N/mm$^2$** to **24 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***THIRTEENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **18 N/mm$^2$** to **32 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***FOURTEENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **26 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **14 N/mm$^2$.**

***FIFTEENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **26 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **14 N/mm$^2$.**

***SIXTEENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **22 N/mm$^2$** to **26 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***SEVENTEENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **24 N/mm$^2$** to **30 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***EIGHTEENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **18 N/mm$^2$** to **28 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***NINETEENTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **26 N/mm$^2$** to **34 N/mm$^2$.**

RC Shear Wall – Found to be **10 N/mm$^2$.**

***TWENTIETH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **22 N/mm$^2$** to **26 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***TWENTY FIRST FLOOR – TOWER-C***

RC Slab – Found to be in the range of **22 N/mm$^2$** to **28 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***TWENTY SECOND FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **32 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***TWENTY THIRD FLOOR – TOWER-C***

RC Slab – Found to be in the range of **24 N/mm$^2$** to **28 N/mm$^2$.**

RC Shear Wall – Found to be **10 N/mm$^2$.**

***TWENTY FOURTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **32 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

***TWENTY FIFTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **20 N/mm$^2$** to **24 N/mm$^2$.**

RC Shear Wall – Found to be **10 N/mm$^2$.**

***TWENTY SIXTH FLOOR – TOWER-C***

RC Slab – Found to be in the range of **18 N/mm$^2$** to **24 N/mm$^2$.**

RC Shear Wall – Found to be in the range of **10 N/mm$^2$** to **12 N/mm$^2$.**

## 5.4 Cover meter studies to measure the thickness of cover concrete.

Cover meter studies were carried out on various RC members in order to assess the thickness of cover concrete peripheral rebars in the RC members. The test was conducted using Profometer-5+ from M/s. Proceq, Switzerland as per the guidelines furnished by the

manufacturer's manual. The results of the tests are tabulated in **Test Report.**

The cover meter study revealed that the cover concrete provided to the rebars were observed to be inadequate at most of the locations.

## 5.5 Semi-Destructive test to assess the strength of concrete in RC members of Common Basement floor & Tower C.

Semi-Destructive test such as core test was resorted to in order to assess the strength of concrete in identified RC members of tower-C and common basement of Tower-B& C. **Forty five concrete samples** were extracted from RC Columns at randomly selected locations from Tower-C and Common Basement floor in Tower B & C. Prior to core extraction profometer scanning was carried out on identified RC members to avoid cutting of rebars.

The extracted core samples were subjected to compressive strength test after necessary edge trimming and capping as per guidelines in Indian standard **IS: 516-Part 4(2018).**

The extracted core samples were observed to be homogeneous and free from any voids/ porosities. The results of the test are tabulated in **Test Report.**

**Following are the Tower/ Floor /Member-wise results:**

***COMMON BASEMENT FLOOR – TOWER B & C***

RC Columns -Compressive strength ranges from **21.8 N/mm$^2$** to **37.3 N/mm$^2$**

RC Beams -Compressive strength ranges from **26.6 N/mm$^2$** to **43.4 N/mm$^2$**

RC Shear Wall -Compressive strength ranges from **23.9 N/mm$^2$** to **35.0 N/mm$^2$**

***GROUND FLOOR – TOWER C***

RC Columns -Compressive strength ranges from **21.9 N/mm$^2$** to **34.3 N/mm$^2$**

RC Beams -Compressive strength ranges from **26.0 N/mm$^2$** to **28.6 N/mm$^2$**

***SECOND FLOOR– TOWER C***

RC Beam -Compressive strength ranges from **24.7 N/mm$^2$** to **37.9 N/mm$^2$**

RC Slab -Compressive strength ranges from **25.9 N/mm$^2$ to 42.3 N/mm$^2$**

RC Staircase Waist Slab -Compressive strength is **29.5 N/mm$^2$**

***FIFTH FLOOR– TOWER C***

RC Columns -Compressive strength is **16.9 N/mm$^2$**

RC Slab -Compressive strength is **33.9 N/mm$^2$**

***SEVENTH FLOOR– TOWER C***

RC Shear Wall -Compressive strength is **26.2 N/mm$^2$**

RC Slab -Compressive strength is **34.7 N/mm$^2$**

***TWELFTH FLOOR– TOWER C***

RC Beam -Compressive strength is **22.3 N/mm$^2$**

***FOURTEENTH FLOOR– TOWER C***

RC Column -Compressive strength is **20.3 N/mm$^2$**

***TWENTY FORTH FLOOR– TOWER C***

RC Shear Wall -Compressive strength is **24.7 N/mm$^2$**

**Acceptance Criteria (As per clause 17.4.3 of IS: 456-2000)**

As per **Clause 17.4.3 of IS:456-2000**, concrete in the member represented by a core test shall be considered if the average equivalent cube strength of the cores is equal to at least 85% of the cube strength of the grade of concrete specified for the corresponding age & no individual core has a strength less than 75%.

## 5.6 Half-cell potential measurement test on RC members to assess the probability of corrosion.

Half-Cell Potential Measurement Test was carried out on Common Basement floor of Tower-B & C and RC members of Tower-C at random by using Copper-Copper Sulphate Half-Cell to assess the probability of corrosion in reinforcing bars. The test was conducted using **CANIN** equipment from **M/s. Proceq, Switzerland** as per the guidelines in **ASTM C876-15 (Reapproved 2015)** &furnished by the manufacturer's manual.

The results of the test are tabulated in **Test Report &** the corresponding reference chart is appended

The results of the test indicate that the Probability of corrosion in tested RC members is found to be as detailed below.

**Following are the Tower/ Floor /Member-wise results:**

***COMMON BASEMENT FLOOR – TOWER B & C***

- RC Columns - **Low Probability of Corrosion to High Probability of Corrosion**
- RC Beams - **Uncertainty of Corrosion to High Probability of Corrosion**
- RC Corbels -**Low Probability of Corrosion to Uncertainty Probability of Corrosion**

***GROUND FLOOR-TOWER-C***

- RC Columns - **Uncertainty of Corrosion to High Probability of Corrosion**
- RC Beams - **Uncertainty of Corrosion**

***TENTH FLOOR- TOWER-C***

- RC Shear Wall - **Uncertainty of Corrosion to High Probability of Corrosion**
- RC Beams - **Uncertainty of Corrosion**

***THIRTEENTH FLOOR- TOWER-C***

- RC Staircase Waist Slab - **Uncertainty of Corrosion**

## 5.7 Carbonation test on RC members to assess the loss of alkalinity in concrete.

Carbonation test was carried out on RC members at common Basement and Tower-C at random using **phenolphthalein indicator of 1gm dissolved in 100 ml solution of 70 ml ethanol & 30 ml of de-ionised water. Dilute Alcohol added with Phenolpthalein indicator** to assess the loss of alkalinity in cover concrete. The test was conducted as per the guidelines in **IS: 516 (Part 5/Sec 3) : 2021.** The results of the test are tabulated in **Test Report.**

The results of the test indicate that the measured depth of carbonation in the tested RC members is found to be as detailed below.

**Following are the Tower/ Floor /Member-wise results:**
***COMMON BASEMENT FLOOR – TOWER B & C***

- RC Columns – 20 mm to 50 mm
- RC Beams - 25mm to 40mm
- RC Shear Wall – 30mm to 35 mm

***GROUND FLOOR-TOWER C***

- RC Columns - 28 mm to 48 mm
- RC Beams - 20 mm to 35 mm

***SECOND FLOOR-TOWER C***

- RC Beams - 15 mm to 25 mm
- RC Slab - 10 mm to 15 mm
- RC Staircase Waist Slab – 15 mm to 20 mm

***FIFTH FLOOR-TOWER C***

- RC Column - 35 mm to 40 mm
- RC Slab - 8 mm to 12 mm

***SEVENTH FLOOR-TOWER C***

- RC Shear Wall - 22 mm to 28 mm
- RC Slab - 12 mm to 18 mm

***TWELFTH FLOOR -TOWER C***

- RC Beam - 25 mm to 30 mm

***FOURTEENTH FLOOR- TOWER -C***

- RC Column - 25 mm to 32 mm

***TWENTY FOURTH FLOOR-TOWER C***

- RC Shear Wall - 18 mm to 24 mm

The results of the test indicate that the carbonation front in concrete has reached up to **reinforcement level** in most of the tested RC members indicating that the cover concrete has already lost its alkalinity which is essential to protect the reinforcing bars against potential corrosion.

## 5.8 Chemical Analysis on collected concrete samples to assess.

### a. Chloride content.

Chloride determination test was carried out on concrete samples collected from the

Common Basement floor RC members of Tower B & C and in Tower C at random locations to estimate the level of chlorides in the concrete as per the guidelines in **IS: 14959(Part 2)-2001.**

The presence of higher amount of chlorides in the concrete surrounding the reinforcement will result in corrosion of rebars. The quantity of chlorides in concrete is determined generally by chemical analysis. The results of the test are tabulated in **Test Report.**

The results of the chloride content test in concrete indicate that the level of chlorides in the tested RC members are found to be as detailed below.

**Following are the Tower/ Floor/ Member-wise results:**

***COMMON BASEMENT FLOOR – TOWER B & C***

- RC Column – 0.034 kg/cum to 1.12kg/cum
- RC Beam - 0.034 kg/cum to 0.17 kg/cum
- RC Shear Wall - 0.014 kg/cum to 0.058 kg/cum

***TOWER C – GROUND FLOOR***

- RC Column- 0.058 kg/cum to 0.34 kg/cum
- RC Beam - 0.041 kg/cum to 0.26 kg/cum

***TOWER C – SECOND FLOOR***

- RC Beam - 0.42 kg/cum to 0.60 kg/cum
- RC Slab – 0.63 kg/cum to 0.91 kg/cum
- RC Waist Slab - 0.88 kg/cum

***TOWER C – FIFTH FLOOR***

- RC Column - 0.11 kg/cum
- RC Slab - 0.12 kg/cum

***TOWER C – SEVENTH FLOOR***

- RC Slab - 0.26 kg/cum
- RC Shear Wall - 0.10 kg/cum

***TOWER C – TWELFTH FLOOR***

- RC Beam - 0.10 kg/cum

***TOWER C – FOURTEENTH FLOOR***

- RC Column - 0.10 kg/cum

***TOWER C – TWENTY FOURTH FLOOR***

- RC Shear Wall - 0.11 kg/cum

From the above test results, it is found that the level of Chloride content in the tested RC members is found to be **beyond the permissible limit of 0.6kg/cum in some tested samples and in some samples it is within the permissible limits.**

**b. Sulphate content**

Sulphate determination test in concrete is carried out on concrete samples collected from Common Basement floor RC members of Tower B & C & in Tower C at random to estimate the level of Sulphates in the concrete.

The presence of higher amount of Sulphates in concrete will result in reaction of calcium present in cement with Sulphates, resulting in the deterioration of concrete. The quantity of Sulphates in concrete is determined generally by chemical analysis and is expressed in terms of percentage of Sulphates by weight of concrete. The results of the test are tabulated in **Test Report.**

The results of the Sulphate content test on concrete indicates that the level of Sulphate in the tested RC member was found to be as detailed below.

**Following are the Tower/ Floor/ Member-wise results:**

***COMMON BASEMENT FLOOR – TOWER B & C***

- RC Column – 0.13% to 0.43%
- RC Beam - 0.11% to 0.35%
- RC Shear Wall - 0.12% to 0.42%

***TOWER C – GROUND FLOOR***

- RC Column- 0.24% to 0.45%
- RC Beam - 0.28% to 0.49%

***TOWER C – SECOND FLOOR***

- RC Beam - 0.13% to 0.21%
- RC Slab – 0.11% to 0.14%
- RC Waist Slab - 0.12%

***TOWER C – FIFTH FLOOR***

- RC Column - 0.32%
- RC Slab - 0.17%

***TOWER C – SEVENTH FLOOR***

- RC Slab - 0.22%
- RC Shear Wall - 0.23%

***TOWER C – TWELFTH FLOOR***

- RC Beam - 0.38%

***TOWER C – FOURTEENTH FLOOR***

- RC Column - 0.19%

***TOWER C – TWENTY FOURTH FLOOR***

- RC Shear Wall - 0.28%

From the above test results, it is found that, the level of Sulphate content in the tested RC members are found to be **with in the permissible limit of 4%.**

## 5.9 Chemical Analysis on concrete samples for determination of pH

The level of pH value is carried out on concrete samples collected from Common Basement floor RC members of Tower B & C and Tower C at random & tested as per the guidelines in **NCB 9th International Seminar Vol.3 Page 500 / IS: 2720 (Part 26): 1987 (Reaffirmed 2016).**

The level of pH in fresh concrete is generally in the range of 12 to 14. Due to carbonation, the pH value of concrete will be reduced considerably. When the pH value fall below about 10, the alkalinity of the concrete will not be adequate to protect the rebars against corrosion.

The results of the test are tabulated in **Test Report.**

The pH value of the interior concrete in the tested RC members is found to be as detailed below.

**Following are the Tower/ Floor/ Member-wise results:**

***COMMON BASEMENT FLOOR – TOWER B & C***

- RC Column – 13.64 to 13.92
- RC Beam - 13.61 to 13.85
- RC Shear Wall – 13.83 to 13.92

***TOWER C – GROUND FLOOR***

- RC Column- 13.78 to 13.88
- RC Beam - 13.85 to 13.90

***TOWER C – SECOND FLOOR***

- RC Beam – 13.37 to 13.45
- RC Slab – 13.21 to 13.44
- RC Waist Slab – 13.51

***TOWER C – FIFTH FLOOR***

- RC Column – 13.93
- RC Slab - 13.37

***TOWER C – SEVENTH FLOOR***

- RC Slab – 13.46
- RC Shear Wall - 13.43

***TOWER C – TWELFTH FLOOR***

- RC Beam – 13.38

***TOWER C – FOURTEENTH FLOOR***

- RC Column – 13.47

***TOWER C – TWENTY FOURTH FLOOR***

- RC Shear Wall – 13.49

From the above test results, it is found that, the level of pH content in the tested RC members are found to be **within the desirable limit in Common Basement of Tower B&C and Tower C.**

## 5.10 Electrical Resistivity of Concrete using Resipod to determine the likelihood of corrosion.

Electrical Resisitivity test conducted on RC members to determine the likelihood of corrosion. The Resipod is an evolution of the industry standard CNS Farnell RM MKII resistivity meter, operating on the principle of the Wenner probe.The Resipod is designed to measure the electrical resistivity of concrete. A current is applied to the two outer probes and the potential difference is measured between the two inner probes. The current is carried by ions in the pore liquid. The calculated resistivity depends on the spacing of the probes. Resistivity $\rho = 2\pi aV/I$ [kΩcm] The test was carried out using resipod equipment from M/s. Proceq, Switzerland as per the guidelines of RILEM TC 154-EMC: Electrochemical Techniques for measuring mettalic corrosion and instrument manual. The results of the test tabulated in **Test Report** and corresponding likelihood of corrosion chart.

## 5.11 Infrared Thermography on distressed regions to assess the extent and source of dampness in RC members.

Infrared thermography was conducted to scan the affected damp locations and possible source of leakages in the identified RC walls. Infrared images are captured of the surface and surface temperature were measured to identify the damp spots. The surface having low temperature is shaded by blue color than adjoining areas having higher temperatures.

The suspected surface of RC wall etc. were scanned by infrared thermal imaging.

The temperature gradient of the surface is also given in the scale attached right to the image. The variations of temperature from minimum to maximum of the particular surface can be identified from the infrared images. The dark blue color areas are showing as wet patches near to source of the leakages. The thermal imaging was carried out using infrared camera-Model No. “Flir C5” make by Teledyne FLIR LLC.

The infrared images taken at different locations along with observations are appended in appendix section. The infrared images taken at different locations with grid identification are given from Page 01 to 23.

### 5.12 Test on water sample.

Oozed out water from the flooring was collected and subjected to chemical analysis to understand the impact of water on the pile foundation. The test was conducted as per guide lines of IS 456: 2000, IS3025( Part-11,17, 18): 2022, IS3025( Part-22,23): 1986, IS3025( Part-24/sec-1): 2022, IS3025( Part-32):1988 to verify the suitability of water for construction of plain/ reinforced concrete.

From the results of the water test, it is evident that the water below the grade slab/flooring does not confirms to requirements of IS 456: 2000 for plain/ reinforced concrete construction.

### 6.1.1 ABSTRACT

This document presents the details regarding the structural analysis of the existing building, “Tower – C” of Chanderkunj Army Towers at Silver Sand Island, Kochi. The structural analysis was performed using Etabs V 19. The Mathematical model used for the analysis was prepared using the available good for construction drawings (GFC) of Tower-C provided by AWHO, Kochi.

### 6.1.2 CODES, STANDARDS & PROJECT SPECIFICATION

All the structural elements were analyzed & designed in accordance with the requirements and recommendations of the reference codes and standards prevailing at the time of construction to assess the performance of the existing structure. The reference codes & standards are based on the following documents.

#### 6.1.2.1 REFERENCE CODES & STANDARDS

- IS 456: 2000 – Code of Practice for Plain & Reinforced Concrete
- IS 875: Part 1: 1987 – Code of practice for design loads (Other than Earthquake)for buildings & Structures
- IS 875: Part 2: 1987 – Code of practice for design loads (Other than Earthquake)for buildings & Structures
- IS 875: Part 3: 2015 – Code of practice for design loads (Other than Earthquake)for buildings & Structures
- IS 1893: 2002, Part 1– Criteria for Earthquake Resistant Design of Structures.
- IS 13920: 1993 – Code of Practice for Ductile Design & Detailing of Reinforced Concrete Structures Subjected to Seismic Forces
- Strengthening Codes & Literature.
- NDT Codes

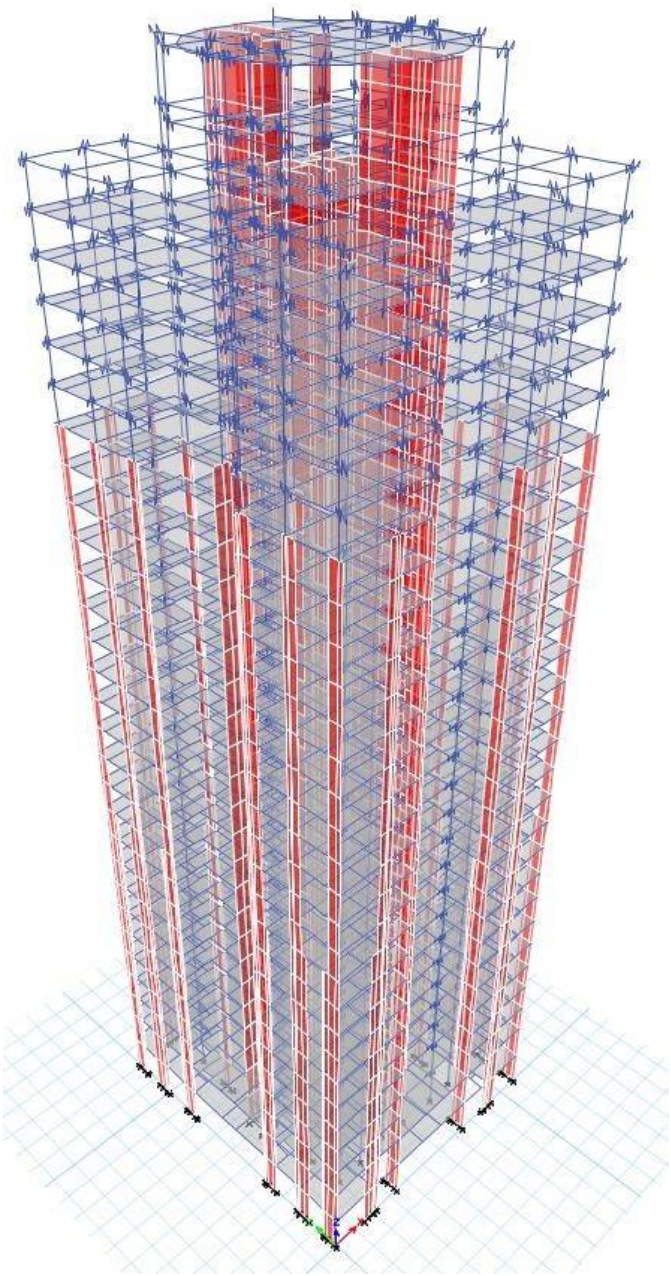
### 6.1.3 PROJECT DESCRIPTION

The objective of this project is to calculate the structural member forces on an existing structure, as per the codes and standards mentioned above, such that a retrofitting strategy can be prepared, which can be used to strengthen the distressed structural members (if required). In order to calculate the force demands on the existing structure, a mathematical model of the existing structure, as shown on “Figure-1”, was made using the structural analysis software Etabs V 19.

The sole intent of this report is to present the loading credentials and assumptions that were made while modelling the mathematical model with the available structural GFC drawings, along with the method of analysis and results that were obtained after the analysis. The analysis results obtained from the mathematical model is used for the design of various structural members, that are present in the building. The mathematical model after analysis and design, which forms the demand data, has be compared with both the original intended capacities of the structural members from the structural GFC drawings and also the calculated probable capacity currently present in the existing structure, after distress. Ultimately, a retrofitting strategy has been proposed, which shall strengthen the existing distressed structure to satisfy the actual force demands.

### 6.1.4 MATHEMATICAL MODEL

## Fig -1– 3D Model



The mathematical model has been modelled using the details provided by the structural drawings submitted by AWHO, Kochi. The columns "C1, C2, C3, C4, C7, C8, C9, C10" from foundation to 22nd storey was modelled as shear walls, since the aspect ratio for these members were greater than '4'.

### 6.1.5 DESIGN LOADS

#### 6.1.5.1 Wall Loads

The wall loads were applied as line load on beams.

1. Height of wall = 3.75m
   - *Load applied for 20cm wall = 13.5 kN/m*
   - *Load applied for 10cm wall = 6.75 kN/m*

2. Height of wall = 2.8m
   - *Load applied for 20cm wall = 10.1 kN/m*
   - *Load applied for 15cm wall = 7.3 kN/m*

3. Height of wall = 2.7m
   - *Load applied for 30cm wall = 14.6kN/m*
   - *Load applied for 20cm wall = 10 kN/m*
   - *Load applied for 15cm wall = 5 kN/m*

4. Parapet Wall, Lift openings & miscellaneous line loads
   - *Load applied = 5 kN/m*

5. Sunshade
   - *Load applied = 1.5 kN/m*

6. Balcony Handrail / Parapet
   - *Load applied = 2.5 kN/m*

#### 6.1.5.2 Floor Loads

1. **GROUND FLOOR**
   - *Live load = 3kN/m$^2$*
   - *Floor finish = 1kN/m$^2$*
   - *Transformer room load = 15kN/m$^2$*

2. **1st FLOOR TO 26th FLOOR (TYPICAL)**
   - *Live load = 2kN/m$^2$*
   - *Floor Finish = 1 kN/m*
   - *Toilet live load =2kN/m$^2$*
   - *Toilet Fill = 3kN/m$^2$*

- *Passage = 3kN/m²*
- *Balcony = 3kN/m²*

**3. TERRACE FLOOR**

- *Roof live = 1.5kN/m²*
- *Roof floor finish = 0.5kN/m²*
- *Lift area live = 3kN/m²*
- *Lift area floor finish = 1kN/m²*

***4. MACHINE ROOM***

- *Machine load = 15kN/m²*
- *Live loads = 3kN/m²*
- *Floor finish = 1kN/m²*

***5. MACHINE FLOOR ROOF***

- *Live load = 3kN/m²*
- *Floor finish = 0.5kN/m²*

***6. HELIPAD***

- *Live load = 10kN/m²*
- *Floor finish = 1kN/m²*

### 6.1.5.3 Staircase Load

- *Stair Live line load = 4kN/m*
- *Stair Dead line load =10kN/m*

### 6.1.5.4 Other Vertical Loads

*Water tank load for Overhead Tank = 32kN/m²*

### 6.1.5.5 Wind Load Parameters (IS 875: Part 3: 2015)

**Table 1 – Wind Loading Parameters**

| PARAMETERS | VALUE |
|---|---|
| Wind Speed, $V_b$ (m/s) | 39 |
| Terrain Category | 2 |
| Importance Factor | 1 |
| Risk Coefficient | 1.06 |
| Topography | 1 |
| Windward Coefficient, $C_p$ | 0.8 |
| Leeward Coefficient, $C_p$ | 0.25 |

### 6.1.5.6 Seismic Load Parameters (IS 1893: 2002- Part1)

**Table 2 – Seismic loading Parameters**

| PARAMETERS | VALUE |
|---|---|
| Seismic Zone Factor, Z | 0.16 |
| Soil Type | II |
| Importance Factor | 1.2 |
| Response Reduction Factor, R | 5 |
| Time period along X-direction | 1.24 |
| Time period along Y-direction | 1.24 |

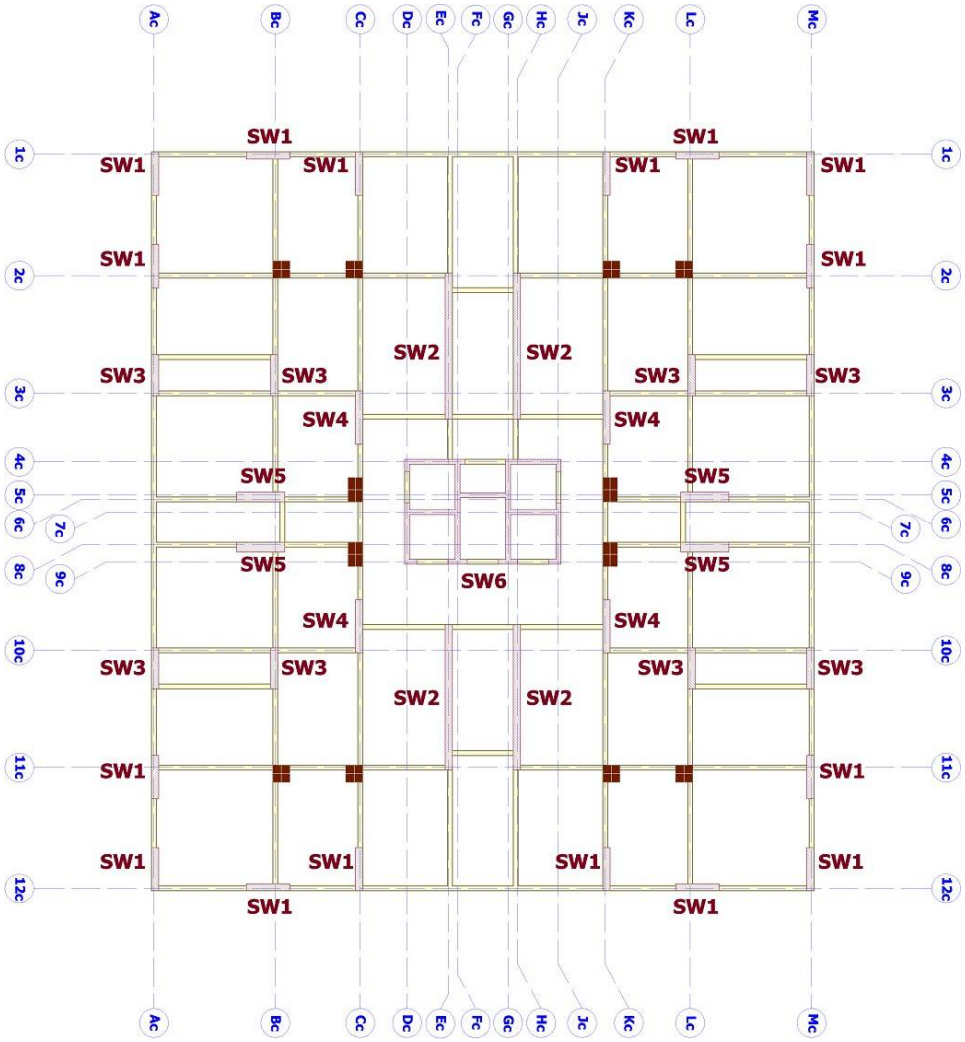


**Fig-2 – Column and Shear Wall layout GF**

The load cases used for the analysis are:

1. Dead - Dead loads including Self weight
2. Live <3 - Live Loads less than 3kN/$m^2$
3. Brick - Wall load on Beam (SIDL)
4. Sunshade - Sunshade Load
5. Roof Live - Live load on roof (Not considered in the mass matrix for modal analysis)
6. Machine - Lift and Transformer loads
7. FF - Floor Finish Load (SIDL)
8. WT - Water load from overhead tank (SIDL)
9. Staircase Dead load - Dead load of Stair applied on beam as Lineload (SIDL)
10. Staircase Live load - Live load of Stair applied on beam as Line load
11. Wind 0 - Wind Load along X – direction
12. Wind 90 - Wind Load along Y – direction
13. Eqx - Equivalent static load case along X – direction
14. Eqy - Equivalent static load case along Y – direction
15. Eqx(+ex) - +ve eccentricity for seismic force along X
16. Eqx(-ex) - -ve eccentricity for seismic force along X
17. Eqy(+ey) - +ve eccentricity for seismic force along Y
18. Eqy(-ey) - -ve eccentricity for seismc force along Y
19. RSPEC - Response Spectrum Load case

The percentage of loads considered in mass matrix for modal analysis is shown below:

Mass = 1× (Dead+Brick+Sunshade+FF+WT+Stair Dead) +0.5× (Machine)
+0.25× (Live<3+Stair Live) Since the location of the building is at seismic zone III,

Dynamic analysis is necessary.

### 6.1.5.7 P-DELTA ANALYSIS

Since this structure falls in the category of Tall building, a second order analysis becomes necessary. Using the software Etabs, an initial p– delta analysis was performed to satisfy this requirement. Since the axial loads due to gravityon buildings are generally constant, the p -delta effects on its structural elements will vary only based on the magnitude of its axial load and its length. The type of axial load on structural members will determine its change in lateral stiffness. When a structural member isin tension, its lateral stiffness increases due to tension stiffening & while during compression,its lateral stiffness reduces due to compression softening. This change in stiffness does not depend on the mechanical property and only depend on the magnitude of axial force and length of the member. Therefore, in order to accommodate this change in lateral stiffness with material stiffness, etabs creates a geometric / stress stiffness matrix, which when combined with the material stiffness matrix, forms the total stiffnes matrix, which accounts the P-delta effects in a linear analysis. Since iteration of load combination is not required in an initial P-delta method, this method can be used for dynamic analysis by using the stiffness matrix after P-delta analysis in the Modal analysis.

In this project, the initial P-delta analysis for the service model was performed with unfactored gravity loads (all dead and live loads). For the design model, the P-delta analysis was performed using a factor of safety of 1.2 on all gravity loads. This load combination can provide a conservative result. Since we account the second order effects from the analysis model itself, it is not required to calculate the stability index.

### 6.1.6 MODAL ANALYSIS RESULTS

The modal analysis on the building bare frame was performed using Eigen method on ETABS V 19. A total of 25 modes were calculated for achieving 90%+ modal mass participation. The modal analysis data is shown on Table 3. The mode shapes of first three eigen modes are shown on Fig : 3, 4 & 5 respectively.

**Table : 3 – Modal analysis results**

| TABLE: Modal Participating Mass Ratios | | | | | | | | | | | | | | |

**Fig : 5 – Mode shape of 3rd Mode**

#### 6.1.6.1 Maximum Storey Displacement

IS 16700 limits the maximum displacement due to wind load to H/500, where ~~H is the~~ total height of the building. Therefore, the maximum displacement limit is = (6.92×1000)/500= 193.84mm.

The wind load only load case along X direction has a maximum displacement of 106mm & the wind load along Y direction has a maximum displacement of 69mm. Therefore, the maximum storey displacement is within the limit.

#### 6.1.6.2 Maximum Storey Drift

The governing load case for the storey drift calculation was 'EQX(-ecx)' along X – direction & 'EQY(-ecy)' along Y - direction. The maximum storey drift ratio is limited to 0.004 byboth IS 1893-2002

**Table 1.5 – Maximum Storey Drifts**

## 6.2 ABOUT THE DESIGN ANALYSIS

In order to calculate the force demands of the existing structure, a mathematical model of the existing structure was made using the structural analysis software ETABS V19 and ETABS Model of Tower C without distress condition i.e., 100% health condition of the building. The reinforcement details read from GFC drawings and applied in the ETABS Model. In the preparation of mathematical model- ETABS Model all the parameters used as given in Design Basis Report, the details of floor loading, wind parameters and seismic parameters, grade of concrete and grade of steel were presented. The sizes of the structural members, the reinforcement available in the columns and shear walls and other details given in the GFC drawings were used. The strength of concrete in the structural elements as given in GFC & DBR is used in evaluating performance of structure with 100% health condition (without Distress) and with reduced health condition (with Distress) of the building.

The analysis results obtained from the mathematical model used for the design of vertical structural members and Horizontal members i.e., columns, shear walls Beams and Slabs. The mathematical model – ETABS Model results after analysis and design, which forms the demand data, compared with both the original intended capacities of the structural members without any distress and calculated probable capacity of structural members currently present in the existing structure after distress with available strength of concrete and extent of corrosion of rebars due to chloride attack from external and inherent chloride content in the members. Proposed a retrofitting strategy/ methodology to strengthen the existing distressed structure columns, shear walls, beams and slabs, staircase and retaining wall to satisfy the actual force demands due to gravity loads and lateral loads and their combinations as IS Code provision.

The parameters considered for capacity calculations of columns and shear wall are Axial capacity, flexural capacity and shear capacity. The ratio of demand and capacity (D/C) of column and shear wall is calculated for axial load, flexure and shear. The D/C ratio greater than 1 is considered as over stressed, exceeding the capacity of the member and inadequate, while D/C ratio less than 1 is considered adequate.

### 6.2.1 DETAILS RECEIVED FROM AWHO

1. MOU dated 27-12-2022.
2. GFC Drawings
3. Soil Report
4. Architectural Drawings

### 6.2.2 DETAILS NOT RECEIVED FROM AWHO

Retaining wall details

### 6.2.3 DEMAND AND CAPACITY EVALUATION METHOD

#### 6.2.3.1 FOR COLUMNS AND SHEAR WALLS

For the capacity calculation of walls, the shear walls on the ETABS program are assigned as piers. The section properties of the wall were modelled by using the "define general pier sections" option provided on ETABS shear wall design. The design check for columns were done using the "Change design section" option provided in the concrete frame design. The column section properties were modeled during frame element definition. Fig :1 indicate tower C columns and shear wall location

#### 6.2.3.2 Axial & Flexural capacity Calculation:

The design calculation is done using the software ETABS V19. It involves plotting the 3 – dimensional interaction surface with axial load and bi – axial moments representing capacity as shown on Fig 2. The demand axial load and bi – axial moments are marked on the 3D space. This point is marked as L on the 2D plane on Fig 3. A line between origin 'O' and 'L' is extra plotted till the failure curve. The point on the failure cure is the capacity, marked as 'C' on Fig 3. The D/C ratio is the ratio of OC/OL

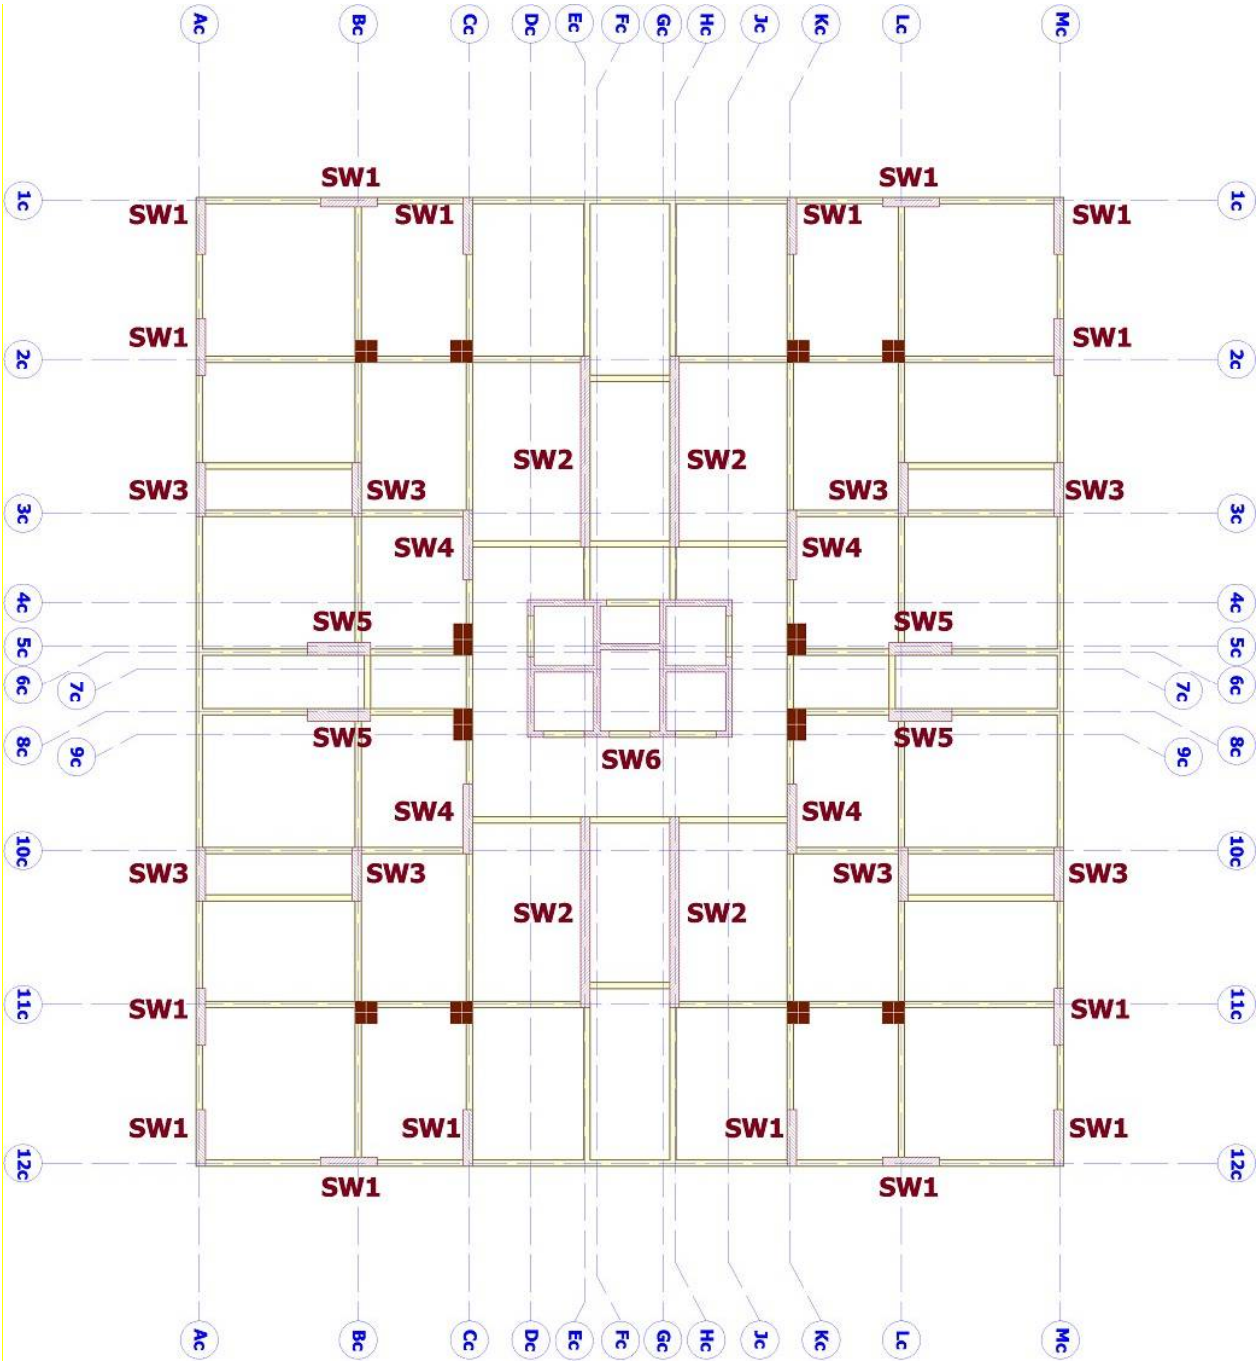

**Fig : 1. Tower C- Column & Shear wall layout**

The Capacity of Columns and Shear walls evaluation procedure is as follows

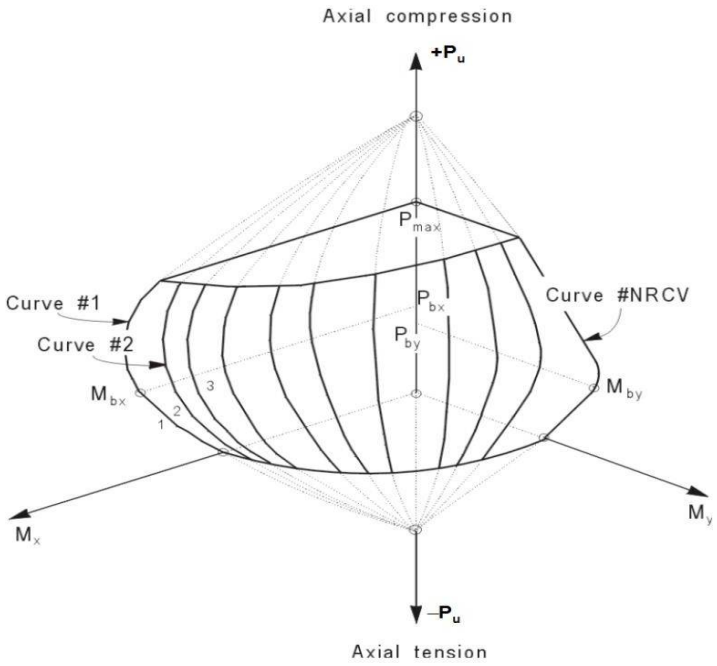

**Fig : 2 – 3D interaction surface**

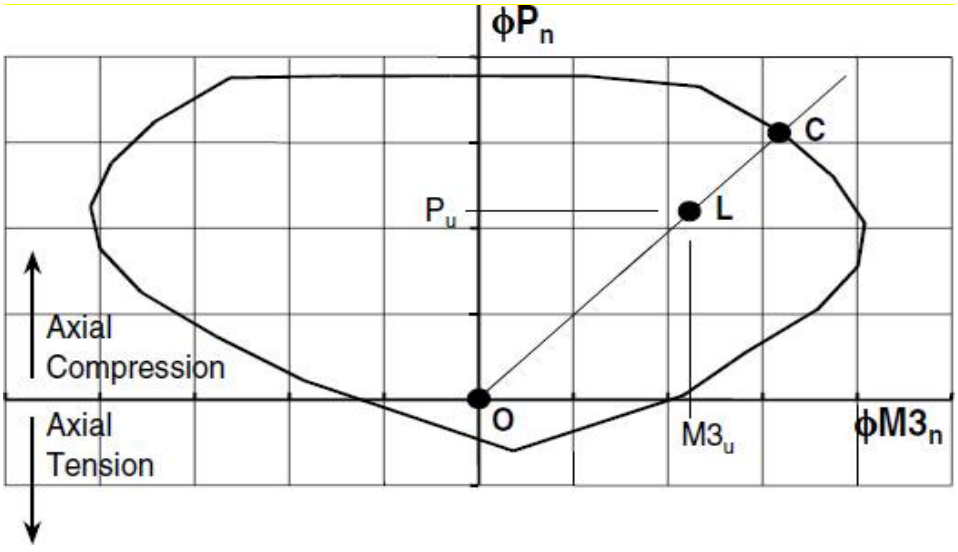

**Fig : 3 – Demand and capacity points on 2D interaction curve**

#### 6.2.3.3 Shear capacity calculation

The shear capacity of concrete for shear walls is calculated as per IS 456. The nominal shear stress is taken as, $\tau_v$ =Vu/ d*t as per IS 13920-1993 where 't' is the thickness and 'd' is the effective width taken as 0.8 times depth of the section considered.

For columns, the shear capacity is calculated following normal IS 456 procedures. The concrete shear capacity of concrete, $V_c$ is calculated from Table 14 of IS 456 for half the percentage of main bars in the design section considered. For both shear walls and columns, the maximum allowable shear is limited to the values provided on Table 9 of IS 456 -2000.

The D/C value is the ratio of demand shear force, shear capacities of concrete, and shear reinforcements combined. A value of D/C ratio less than 1 indicates adequate, while a value greater than 1 indicates over stressed.

#### 6.2.3.4 Classification of distress

The columns and shear walls form the primary components of the structure for lateral resistance. Hence, they are not permitted to undergo more damage or deformations. Therefore, special care should be provided for critical members during retrofitting as well as in ensuring the capacity after retrofitting. For identifying the critical members based on capacity, GEC made 4 numbers of classifications, 2 each for gravity loading and lateral loading respectively. They are **Class α**, **Class β**, **Class γ**& **Class δ**.

The first two classifications, Class α & Class β are considered for only vertical load combinations and the remaining two classifications, Class γ & Class δ are considered for lateral loadcombinations (Wind and Seismic loading). Therefore, a Column section or Shear wall section can have 4 classifications based on the type of load combinations. The details for each classification are

a. *Class α – Adequate capacity for carrying vertical loads/vertical load combinations*
b. *Class β – In adequate capacity for carrying vertical loads/vertical load combinations*
c. *Class γ – Adequate capacity for carrying lateral loads/lateral load combinations*
d. *Class δ – In adequate capacity for carrying lateral loads/lateral load combinations*

#### 6.2.3.5 Precautions before Retrofitting

The columns and shear walls, which belongs to **Class β** are considered very critical, since they have inadequate capacity to carry the vertical loads generated due to the ***dead loads and live loads*** present in the structure. Retrofitting of Class β members shall be done by providing adequate props, which

supports the beams that connect the Class β members, such that the vertical stress on the Class β members can be reduced and redistributed during the retrofitting process. The columns and shear walls, which belong to **Class δ** are critical during the occurrence of lateral loads. Since the probability of occurrence of seismic events is very low, the risk involved in retrofitting of **Class δ** members is much lower than compared to the same for Class β members. However, retrofitting of Class **δ** members shall be done by providing adequate props, which supports the beams that connect the Class **δ** members, such that the vertical stress on the Class **δ** members can be reduced and redistributed during the retrofitting process.

The retrofitting of columns belonging to both **Class α** and **Class γ** can be done without much risk, as they possess enough capacity to carry the vertical as well as lateral loads. However, retrofitting of Class α and Class γ members shall be done by providing adequate props, which supports the beams that connect the Class α and Class γ members, such that the vertical stress on the Class α and Class γ members can be reduced and redistributed during the retrofitting process.

### 6.2.4 REINFORCEMENT CONSIDERATION IN DISTRESS EVALUATION

The building vertical element columns and shear walls having corrosion of reinforcement, the extent of rebar corrosion **assumed** as 5% to 10% for the main reinforcement of the vertical elements and for 50% for the shear links/stirrups. The capacity and demand of the vertical elements, columns and shear walls are evaluated as per the reinforcement provided in the GFC drawings and with reduction in area of reinforcement. The actual strength of concrete in columns and shear walls considered as M25.

### 6.2.5 ANALYSIS AND DISTRESS EVALUATION

The analysis and design of tower C is carried out using the ETABS Model, the ratio Demand / Capacity is evaluated, the ratio Demand / Capacity less than 1, indicates column or shear wall is having adequate capacity to carry the load and there is no distress of the elements. ***The ratio Demand / Capacity greater than 1 indicate column or shear wall is having inadequate capacity to carry the load and there will be distress of the elements, which require strengthening.***

#### 6.2.5.1 Without Distress the followings cases are considered

Case1. Without Distress - Column Design -Gravity Load Case

Case2. Without Distress – Shear Wall Design -Gravity Load Case

Case3. Without Distress - Column Design –Lateral Load Case

Case4. Without Distress – Shear Wall Design - Lateral Load Case

**6.2.5.2 With Distress** the followings cases are considered

Case1. With Distress - Column Design -Gravity Load Case

Case2. With Distress – Shear Wall Design -Gravity Load Case

Case3. With Distress - Column Design –Lateral Load Case

Case4. With Distress – Shear Wall Design - Lateral Load Case

The design details of columns and Shear Walls for all the above-mentioned cases Without Distress & with Distress are presented in Annexure 1 to 8.

ETABS Result Sheets given in Annexure 1 to 8 to be read in conjunction with Table A1 to check the values of Columns & Shear walls capacities and demand for Gravity Loading and Lateral Loading of with Distress and Without Distress output results of ETABS model.

**Table A1 – Column & Shear wall ID Drawing/ETABS Model**

| Drawing ID | ETABS Section ID (All Floors) |
|---|---|
| C1 | P1, P6, P31, P36. |
| C2 | P2, P5, P32, P35. |

## Demand/ Capacity Ratio for Columns & Shear Wall

Demand / Capacity Ratio - Refer Annexure 1 to 8, for with and without distress cases

**Without Distress** the followings cases are considered

Case1. Without Distress - Column Design -Gravity Load Case

Case2. Without Distress – Shear Wall Design -Gravity Load Case

Case3. Without Distress - Column Design –Lateral Load Case

Case4. Without Distress – Shear Wall Design - Lateral Load Case

**With Distress** the followings cases are considered

Case1. With Distress - Column Design -Gravity Load Case

Case2. With Distress – Shear Wall Design -Gravity Load Case

Case3. With Distress - Column Design –Lateral Load Case
Case4. With Distress – Shear Wall Design - Lateral Load Case
Summary of D/C ratio with distress Gravity Load Case - Refer Annexure 9
Summary of D/C ratio -with distress Lateral Load Case- Refer Annexure 10

NR - Not Required, R – Required

### 6.2.6 BEAMS EVALUATION

There are 135 beam in Ground floor level, 152 beams in First Floor Level and 140 beams in the Typical Floors. As per the analysis and design without any distress, the required reinforcement for beam are marginally high compare to the provided reinforcement (Refer Annexure 11 to 14). Few beams are requiring strengthening due to degradation due to corrosion of rebars at various floors, refer annexure 11 to 15.

Annexure 11- Ground Floor Beam Details

Annexure 12- 1st Floor Beam Details

Annexure 13- 2nd & 3rd Floor Beam Details

Annexure 14- 4th to 10th Floor Beam Details

Annexure 15- 11th to 22nd Floor Beam Details

Beams with distress shall be strengthened by concrete encasement providing additional T20/T16 based on degradation level based on site condition.

| Schedule of beams to be strengthened due to distress | |
|---|---|

### 6.2.7 SLABS EVALUATION

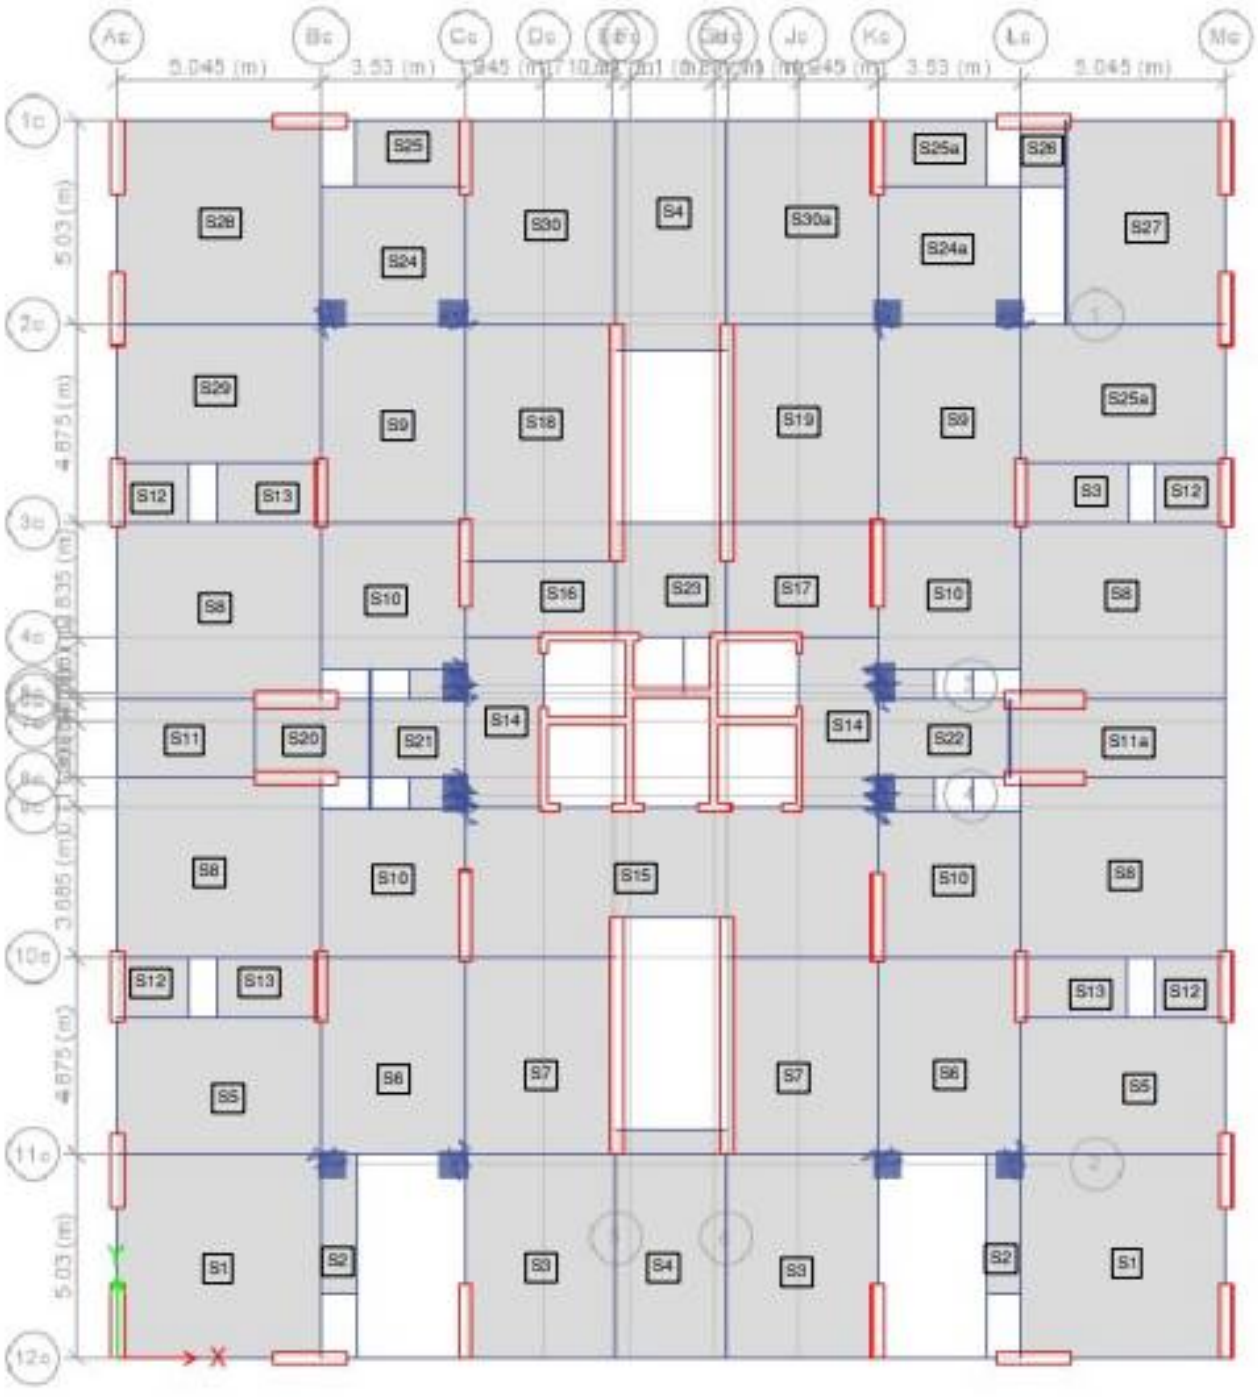
There are 35 Slab panels in the Ground Floor, 24 slab panels in the First Floor and also 24 slab panels Second and Typical floors. From analysis and design, the provided reinforcement is more than the require reinforcement for flexure and shear, however few slab panel are not satisfying the deflection criterion and given in Annexure 16. Due to aggressive environment and other degradation parameters, the slabs are under distress with corrosion of rebar, spalling of concrete is observed in the ground floor slab and require strengthening. Deflection contour for the floor plates ate provided in Annexures 17 to 19.

Annexure 16- GF, FF & Typical Floor reinforcement Demand

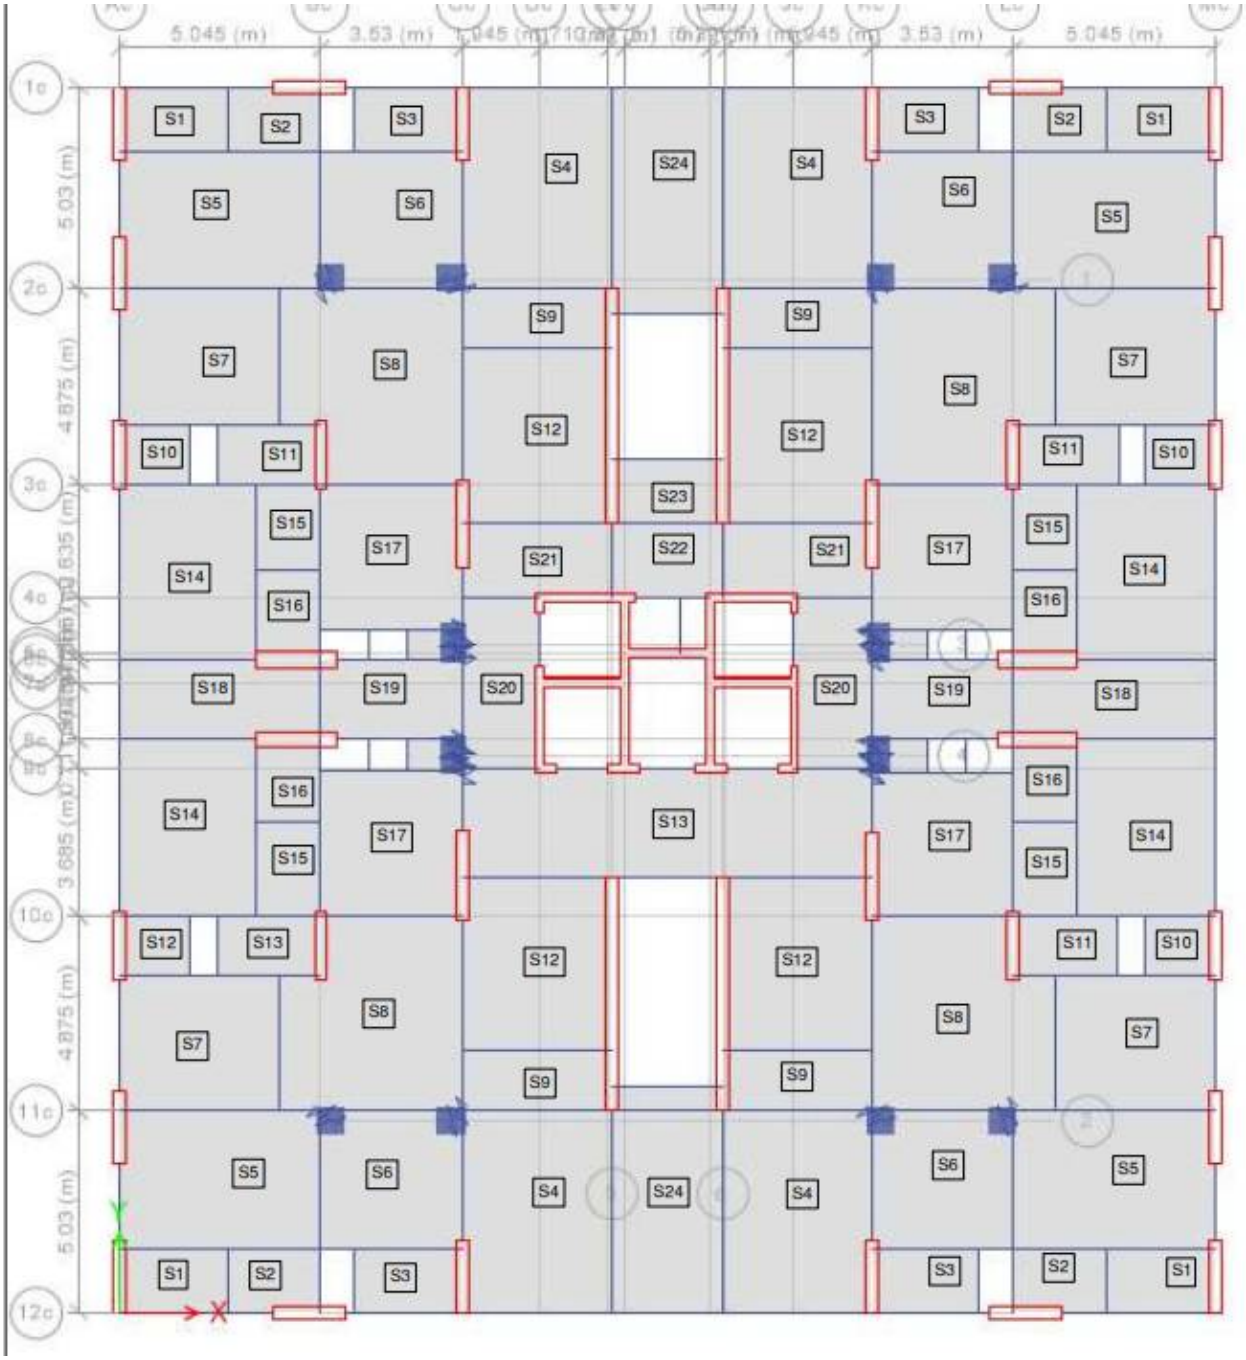
Annexure 17- Ground Floor Deflection Contour

Annexure 18- First Floor Deflection Contour

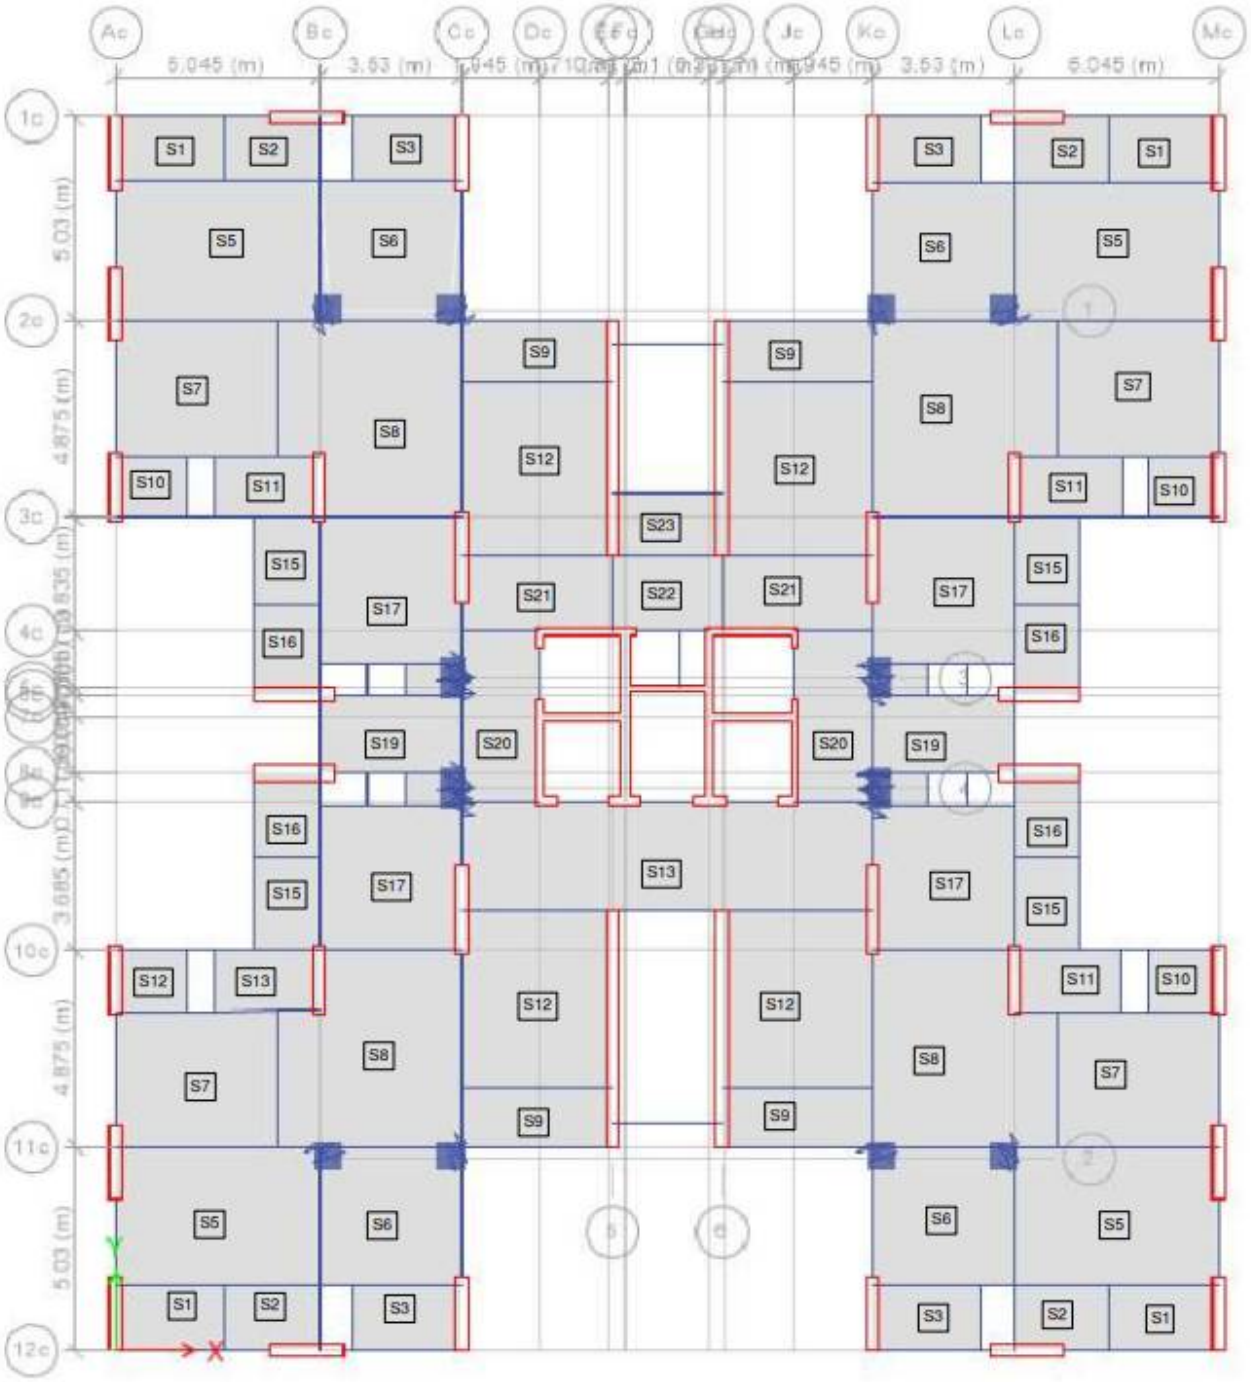
Annexure 19- Second Floor Deflection Contour



Ground Floor - Slab Layout



First Floor - Slab Layout



Typical Floor Slab Layout

### 6.2.8 FOUNDATION EVALUATION

The substructure for Tower C is pile foundation with pile cap, the diameter of the pile s used are P1=800mm ϕ, P2= 1000mm ϕ, P3=1100mm ϕ and P4= 600mm ϕ and depth of pile varies from 45m to 55 m, for the group of pile are provided based on the column loads due to Gravity and lateral load cases. Pile Cap PCA, PCB, PCC, PCD, PCE, PCF and PCQ.

Utility ratio of group of piles i.e., Demand /Capacity for gravity loads and seismic loads are given for the Tower C are provided in Annexure 22.

Table: A2, Depicts Demad Vs Capcity of Piles

| **Tower C** | | | | | | | |
|---|---|---|---|---|---|---|---|
| **Demand / Capacity of Total Piles** | | | | | | | |
| Total Weight of the Building-( DL + LL) | | | | | = | 161788 kN | |
| Total Weight of the Building-(DL+LL+EQ) | | | | | = | 278574 kN | |
| **Pile Name** | **Dia** | | **Capacity of 1 Pile** | **Nos.** | **Total Capacity** | | |
| P1 | 800 | mm | 1800 | 24 | 43200 kN | | |
| P2 | 1000 | mm | 2800 | 48 | 134400 kN | | |
| P3 | 1100 | mm | 3500 | 60 | 210000 kN | | |
| P4 | 600 | mm | 1200 | - | | | |
| **Capacity of All Piles** | | | | | = | **387600**kN | |
| **Demand / Capacity- DL + LL** | | | | | = | **0.42** | **Okay** |
| **Demand / Capacity- DL + LL + EQ** | | | | | = | **0.72** | **Okay** |

### 6.2.9 RETROFITTING METHODOLOGY

From Fig – 3.6, class – β columns & walls can be identified, similarly from Fig- 3.7, *Class δ* – columns & walls can be identified, the extra reinforcements and cross –sectional area required to maintain a stress ratio of 0.85 is provided below. Fig – 4.1 shows the typical encasement details on all sides of rectangular column / wall section, fig – 4.2 shows the typical encasement details on all sides for square columns, Fig – 4.3 shows the typical encasement details on one longer side of columns / walls & Fig 4.4 shows the typical encasement details on three sides of columns/walls. The additional reinforcements required for all columns and walls are shown on Table 4.1 & Table 4.2.

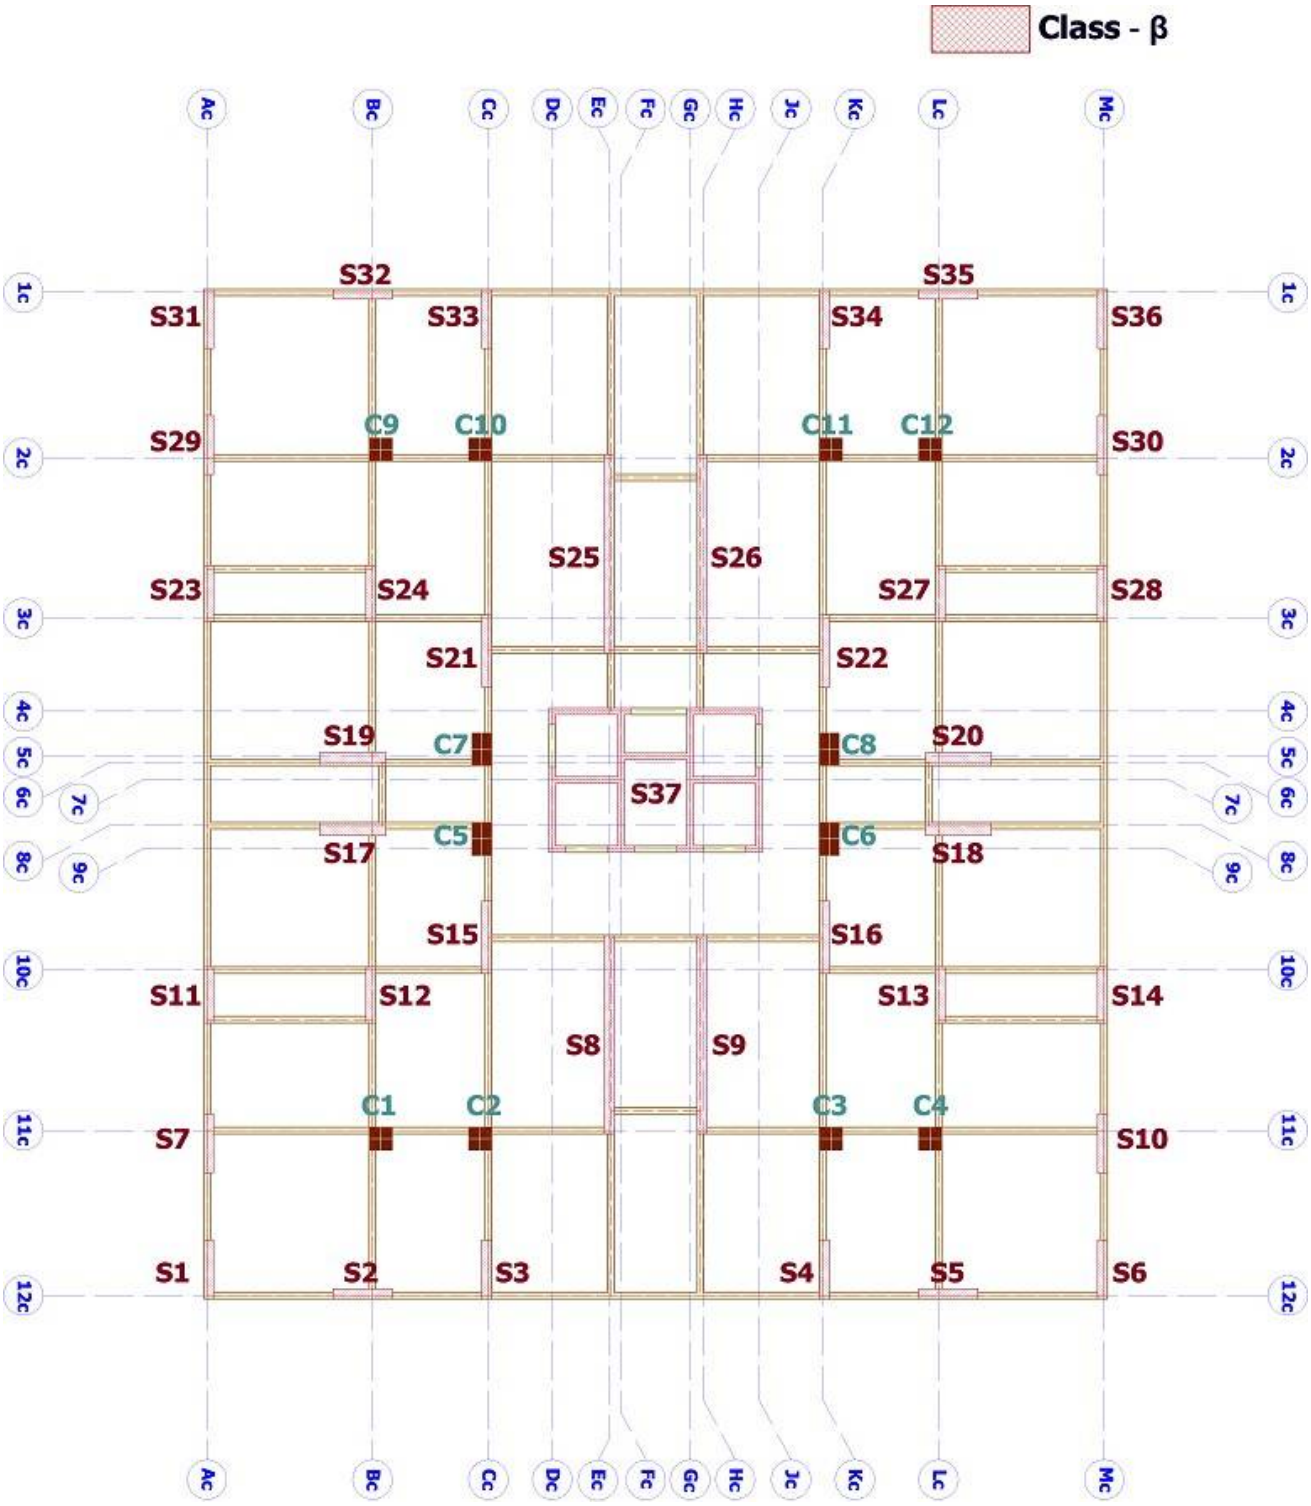


*Fig :3.6 Class β- columns & walls layout- Tower C*

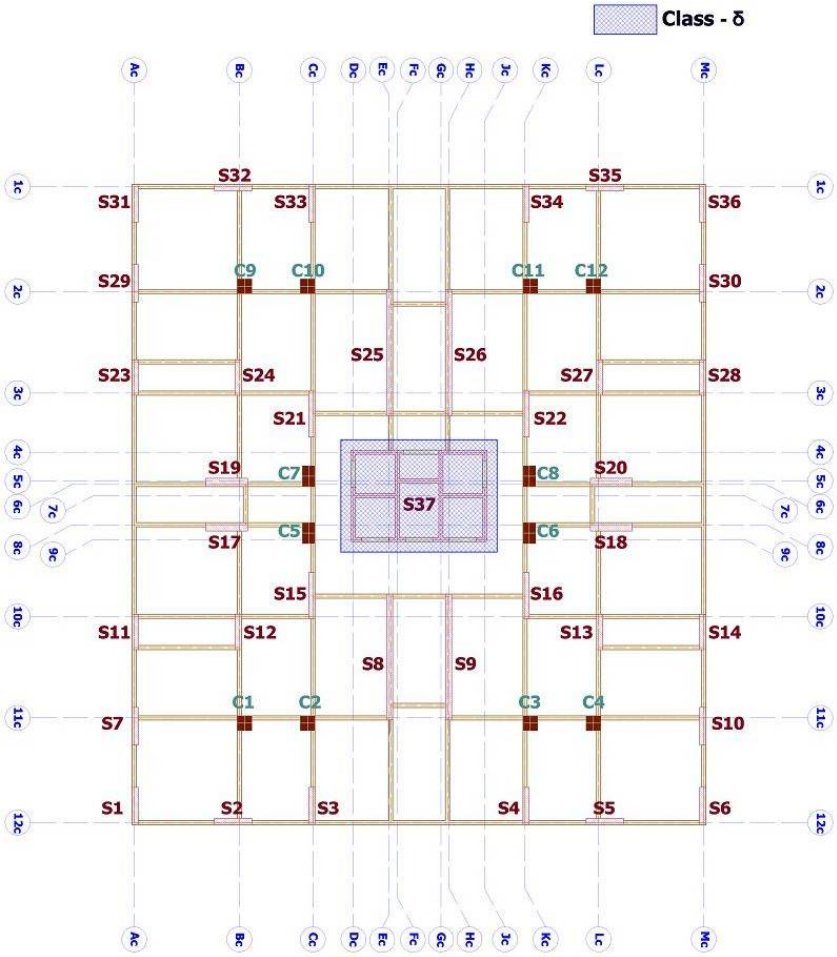

*Fig 3.7 Class δ - columns & walls layout- Tower C*

***Figure 4.1 – Typical encasement details for rectangular columns / walls***

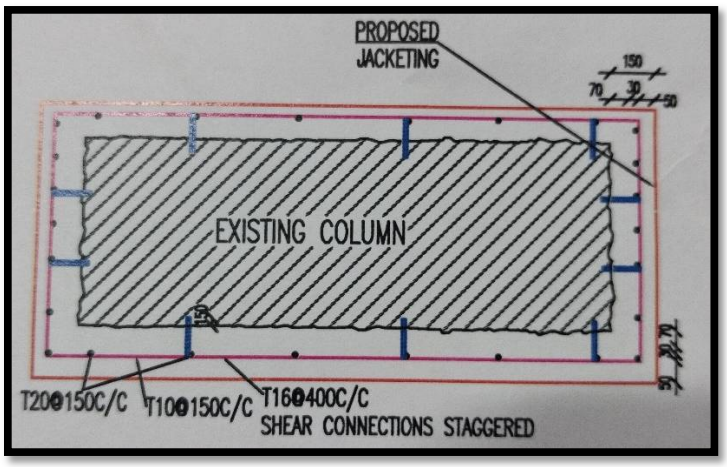

***Figure 4.2 – Typical encasement details for square column***

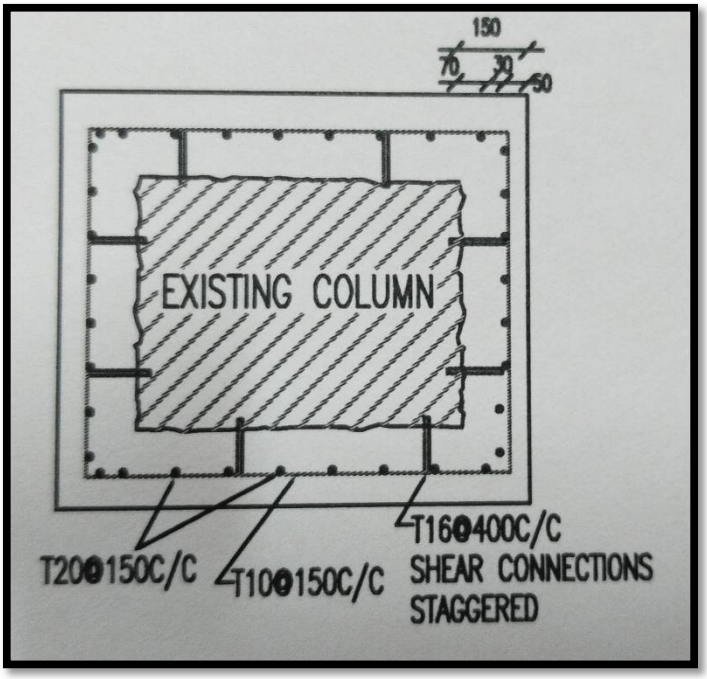

*Figure 4.3 – Typical encasement details for rectangular columns (One side only)*

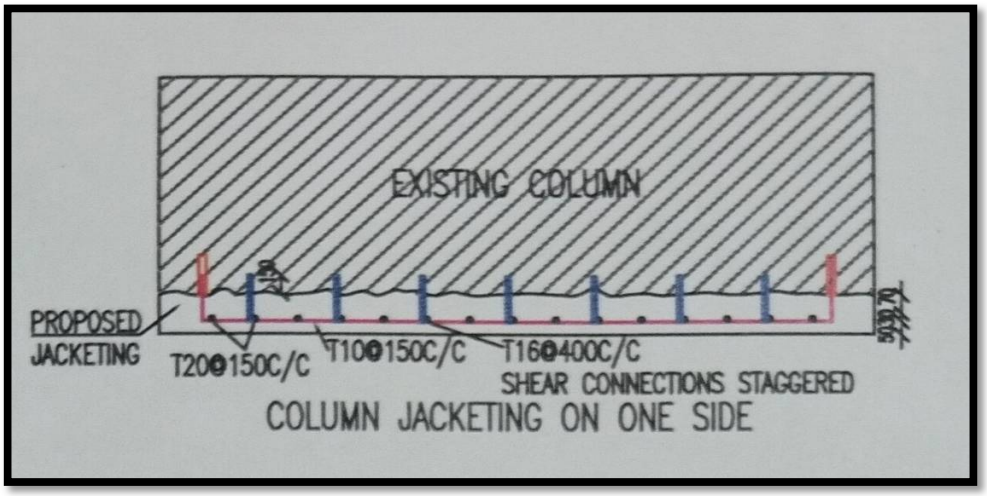

It is observed from the table 4.1 & 4.2 the proposed methodology for strengthening of columns and shear wall is found acceptable. The design requirement and calculation of jacketing thickness and reinforcement required in the jacketing is to furnished.

The other columns and shear walls require strengthening based analysis and design, & utilization ratio are given Annexure 9 & 10.

*Table 4.1 – Additional reinforcements for columns / walls as per Floor-wise*

Note: Provide T10 @150c/c for horizontal Bars

1. The retrofitting process on Class β (pronounced as 'Beta') members can be done only after reducing the vertical loads on the structure. Since we cannot reduce the dead load on the structure, it is advised to reduce the live loads on the structure(if possible) while doing the retrofitting on Class β members.
2. It is recommended to do retrofit only 25 percent of Class β members at a time, since they carry the dead loads and lives loads on the structure.
3. It is recommended to do retrofit only 25 percent of Class δ (pronounced as 'Delta') members at a time, since they carry the lateral loads on the structure.
4. Vehicle traffic within the basement and stilt floors shall be avoided during the retrofitting process, so as to avoid vibrations to the temporary support structures.
5. The electrical, plumbing and fire service lines provided in the basement floors as well as the stilt floors will have to be rerouted to aid the temporary support structures and retrofitting process.

### 6.2.10 DESIGN CONCLUSION

1. The scope of work of BV is to establish Condition Assessment of Structure conducting NDT tests and based on NDT results the distress level of the structural components Structural Assessment of Tower B & C. To provide BOQ for the retrofitting works and to propose 3 contractors for retrofitting works. There is no binding for BV in deciding the retrofitting contractors and the status of the building with distress and continued distress and it is sole responsibility of AWHO.
2. Structural Assessment of Tower C with preparation of ETABS Models without distress (100% health condition) and ETABS Model with distress considering reduction in area of steel due to corrosion.

3. The hard copies of the GFC drawings, soil report, Pile testing details, Pile and pile cap details, slabs and beam details were made available to Bureau Veritas. The same GFC drawings were used in evaluating the capacity of the structural elements with & without distress.
4. ***The building is located in very severe environment as per IS456, Cl 8.2.2.1 and table 3. From the drawings, it is observed that cover provided for columns and walls are on lesser side, which will have direct impact on durability of structure.***
5. Prepared ETABS model without and with distress and used in Demand and Capacity of Structural evaluation for Gravity Loads and Lateral Loads. We have done analysis and design for tower –C with the following load combinations

| |
|---|
| a) Without distress ETABS Model for Tower C – Gravity Loading |
| b) With Distress ETABS Model for Tower C- Gravity Loading |
| c) Without distress ETABS Model for Tower C – Lateral Loading |
| d) With Distress ETABS Model for Tower C- Lateral Loading |

6. The reinforcement provided in the GFC drawings supplied to us are used in evaluation of capacity and demand of columns and shear walls for towers C with and without distress.
7. The proposed percentage reduction in main reinforcement is about 5% to 10% and 50% reduction in diameter of the bars for stirrups/rings of the vertical structural members(columns and shear walls) due to corrosion.
8. Based on The NDT results, the actual compressive strength of concrete 25MPa (M25 Grade) is considered in the structural members for analysis and design.
9. Demand vs Capacity of Columns and Shear without distress is provided from basement floor to terrace level i.e all the floors. Based on design strength of concrete and reinforcement in the GFC is used in the analysis of all the floors in the ETABS model.
10. Demand vs Capacity of Columns and Shear with distress is provided from basement floor to terrace level i.e all the floors. The actual compressive strength of concrete obtained from NDT and reduced cross section of the reinforcement provided in GFC due to corrosion of rebars is used in the analysis of all the floors in the ETABS model.
11. *The strengthening of columns, shear wall, Beams and slabs is required as per the design requirement for without and with distress condition.*

12. Strengthening of all columns and Shear Wall are proposed from basement floor and above are given in **Table No.4.1.** The main vertical bars shall be T25/T16/T12 per the design requirement and T10 @ 150 c/c as tie reinforcement.
13. Design deficiency in beams and slabs are furnished in Annexure 13 to 18 and based on the distress condition due to degradation beams and slabs calls for strengthening measures as detailed in sketches.
14. The retrofitting process on Class β (pronounced as 'Beta') members can be done only after reducing the vertical loads on the structure. Since we cannot reduce the dead load on the structure, it is advised to reduce the live loads on the structure(if possible) while doing the retrofitting on Class β members.
15. It is recommended to do retrofit only 25 percent of Class β members at a time, since they carry the dead loads and lives loads on the structure.
16. It is recommended to do retrofit only 25 percent of Class δ (pronounced as 'Delta') members at a time, since they carry the lateral loads on the structure.
17. Vehicle traffic within the basement and stilt floors shall be avoided during the retrofitting process, so as to avoid vibrations to the temporary support structures.
18. The electrical, plumbing and fire service lines provided in the basement floors as well as the stilt floors will have to be rerouted to aid the temporary support structures and retrofitting process.
19. The columns and Shear Walls strengthening proposed is given in Annexure 9 & 10.
20. Strengthening of Beams and slabs are presented in sketches.
21. The strengthening proposed on one side, two sides, three sides and four sides of the columns and shear walls based on the feasibility and integrity with other elements. The capacity of strengthened structural members columns and Shear walls are given Table 4.1.
22. Attempt to evaluate the strength/quality of pile and pile caps were made, but due to presence of high-water table evaluation below couldn't be carried out. During the process of evaluation water started oozing out from the floor slab. Oozed out water from the flooring was collected and subjected to test to understand the impact of water on the pile foundation. However, based on the theoretical analysis foundation with pile and pile cap is found to be adequate.
23. M/s Bureau Veritas is not responsible for the distress of the structural members and continued distress if any; AWHO shall appoint experienced retrofitting contractors to carry out the retrofitting works as proposed.

24. The retrofitting suggested in this report is considering the present state of distress of the structure. If a distress (other than that is mentioned in this report) occurs in the structure at a later stage, then suitable retrofitting/rehabilitation work shall be designed and envisaged, which is out of the scope.
25. An active or passive structural health monitoring system can be incorporated on the retrofitted structural elements to monitor the performance of the members after retrofitting, though the design and instrumentation for the same is out of the scope of our study.
26. Tower C is having more distress compared to Tower B, Tower C is to be considered for strengthening on priority.
27. The main cause of distress to the structure is attributed to the enhanced rate of corrosion of steel reinforcement. This is due to the high chloride content in concrete and high rate of carbonation of cover concrete, as evident from the test results given in Bureau Veritas Report. While adopting the retrofitting process, it is recommended to provide proper Cathodic protection to the steel reinforcement, so as to avoid chances of corrosion of reinforcement in future. An expert opinion on procedure adopted for Cathodic protection shall be taken and the same shall be added suitably adopted.

## 11.0 SERVICE LIFE EVALUATION

The exceptional durability of Portland Cement Concrete is a major reason why it is the world's most widely used construction material. But material limitations, design and construction practices, and severe exposure conditions can cause concrete to deteriorate, which may result in aesthetic, functional, or structural problems. Concrete can deteriorate for a variety of reasons, and concrete damage is often the result of a combination of factors.

Generally, for any RC structure that built will have Design Life and Service Life. Distinction needs to be made between Service Life and Design Life, the design life is a period considered (possibly longer than the service life) that will give sufficiently high probability of the structure achieving the required service life. The design life would depend upon the importance of the structure. It would ensure required safety against falling below the target service life. Refer Table A for proposed targeted service life of structures - Euro Code 1(CEN 1994).

The service life of a RC structure is characterized as the time after establishment/construction until such time when expensive repair gets to be essential due to degradation of concrete and steel. The service life of structure, period at which the expected performance of structure fails to meet the design requirement RC building. For RC structures in marine situations, the resistance of concrete to chloride actuated degradation to a great extent controls its long haul strength execution. Concrete weakening because of chloride-induced deterioration can be explained to by a basic service life model comprising of an initiation (start) stage and propagation (spread stage)

Concrete structures are typically exposed to severe environmental and structural loading conditions. Typically, concrete structures have the ability to prevent deterioration for long periods of time. However, premature corrosion and the resulting deterioration in the strength and serviceability performance of concrete structures can occur due to the use of poor quality materials and poor construction practices.

Procedures are available in the literature to predict the service life in the case of building materials and components. In fact there cannot be one general procedure for all types of buildings and environments. Considering the history and the environmental

conditions the procedure will require modification. The deterioration and actual damage levels differ from structure to structure, making it impossible to lay down a strict framework of the procedure and factors that would affect the safety and serviceability of the RC building, in spite of periodic routine maintenance, are required to estimate the remaining life.

**Table A. Design Life of Structure**

Euro -Code-1( CEN-1994) Presents the classification for the target service life as shown below:

| Class | Target Service Life (Years) | Example |
|---|---|---|
| 1. | 1-5 | Temporary structures |
| 2. | 25 | Replaceable structural parts, e.g., bearings |
| 3. | 50 | Building structures and other common structures |
| 4. | 100 | Monumental building structures, bridges and other civil engineering structures |

## 11.1 Causes of Degradation of RC Structures

There are many factors contributing to the degradation of RC structure such as

1. Faulty Design
2. Use of Poor Quality Material
3. Poor Construction Practice
4. Poor Construction Sequence
5. Unskilled Labours
6. Poor Quality Control
7. Ignoring Environmental Conditions & Impact
8. Non Compliance to Standard Code
9. Change in usage of the Building( increase in Load)
10. Chemical Attack/ Resistance

## 11.2 Corrosion of rebars in RC structures

The high-rise Chander Kunj residential Army towers- Tower C with 27 storeys was reported to be constructed in 2017-18 and distress is observed in the RC structural

elements due to corrosion of rebar which resulted in durability issue of the structure. Half-cell potential measurement tests and electrical resistivity tests were carried out to know the extent of corrosion, Profometer test was carried out to assess cover to reinforcement, diameter and spacing of bar, cylindrical cores extracted from RC members were used to assess the compressive strength, establish chloride and sulphate content in the concrete and pH value of pore solutions

In reinforced concrete structures, the pore solution surrounding the reinforcements attains a pH of 12.6 after completion of the hydration reaction. The high alkalinity is buffered at this pH by calcium hydroxide in a lime-rich layer (passive layer) in intimate contact with the surface of the reinforcements. So far, the alkalinity remains at a high pH and the rebars also remain free from corrosion.

Moisture, oxygen dissolved in moisture and aggressive ions (particularly chlorides) are the three important factors necessary to induce corrosion of reinforcement. If oxygen and water are eliminated completely then corrosion will be arrested completely. However, it is normally impossible to eliminate oxygen or moisture from the RC structural elements because these species are inherently present in the structure. But it is possible to remove the aggressive ions (particularly chlorides) from the existing structures by a desalination process or by adding suitable chloride inhibitors.

The reinforcement corrosion is the main cause for the RC structures deterioration, which will result in major durability issue. The corrosion phenomenon is mainly due to two main considerations, which cause reinforcement degradation in concrete to an unsatisfactory degree i.e., (i) Carbonation,

(ii) Chloride induced corrosion.

Carbonation induced corrosion most commonly occurs in relatively dry environments where sufficient carbon oxide to diffuse into the cover concrete is possible. However, in chloride containing environments, the chloride ingress is usually faster than the carbonation process, and it is more likely to cause premature deterioration by degrading the resistance of the structure leading to reduced life of structure.

## 11.3 Carbonation of Concrete

Carbonation occurs when carbon dioxide from the air penetrates the concrete and reacts with hydroxides, such as calcium hydroxide, to form carbonates. In the reaction with calcium hydroxide, calcium carbonate is formed:

$$Ca(OH)_2 + CO_2 \rightarrow CaCO_3 + H_2O$$

This reaction reduces the pH of the pore solution to as low as 8.5, at which level the passive film on the steel is not stable. Carbonation is generally a slow process. In high-quality concrete, it has been estimated that carbonation will proceed at a rate up to 1.0 mm (0.04 in.) per year. The amount of carbonation is significantly increased in concrete with a high water-to-cement ratio, low cement content, short curing period, low strength, and highly permeable or porous paste. Carbonation is highly dependent on the relative humidity of the concrete. The highest rates of carbonation occur when the relative humidity is maintained between 50% and 75%. Below 25% relative humidity, the degree of carbonation that takes place is considered insignificant. Above 75% relative humidity, moisture in the pores restricts CO2 penetration (ACI 201 1992). Carbonation-induced corrosion often occurs on areas of building facades that are exposed to rainfall, shaded from sunlight, and have low concrete cover over the reinforcing steel.

## 11.4 Chloride Induced Corrosion

The existence of chloride in concrete structures is due to

- Its use as an accelerator in the concrete mix,
- The presence of a marine atmosphere and
- The use of deicing salts.
- Use of salt water in Concrete Mix
- Use of aggregate with salt component

Chloride occurs in concrete in three forms: (i) chemically bound, (ii) physically adsorbed and (iii) free chloride. The free chlorides are mainly responsible for rebar corrosion. If the free chloride to hydroxide ratio exceeds 0.6, loss of passivity occurs and corrosion progresses. The presence of free chloride not only alters the Pourbaix equilibrium diagram,

it reduces the area of the passive region as shown in Fig A & B, but also transfer the rebar from the passive to the active region.

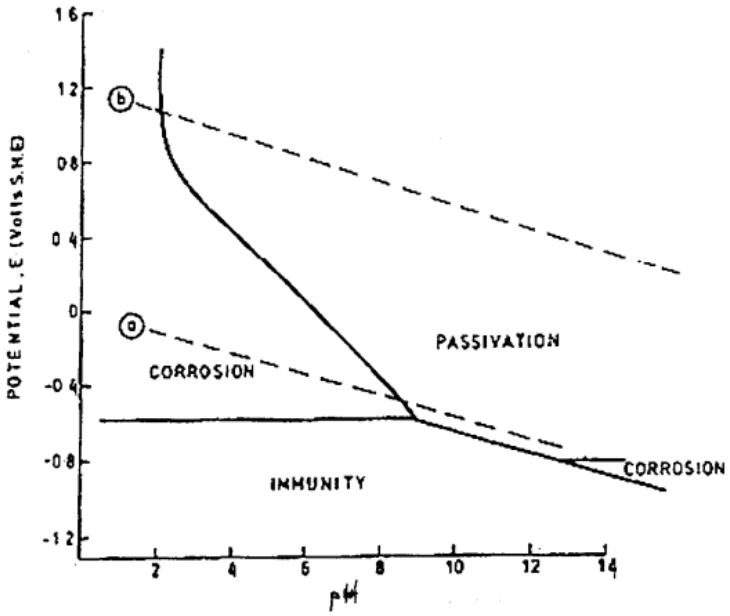

**Fig A. Effect of PH value on paasive layer**

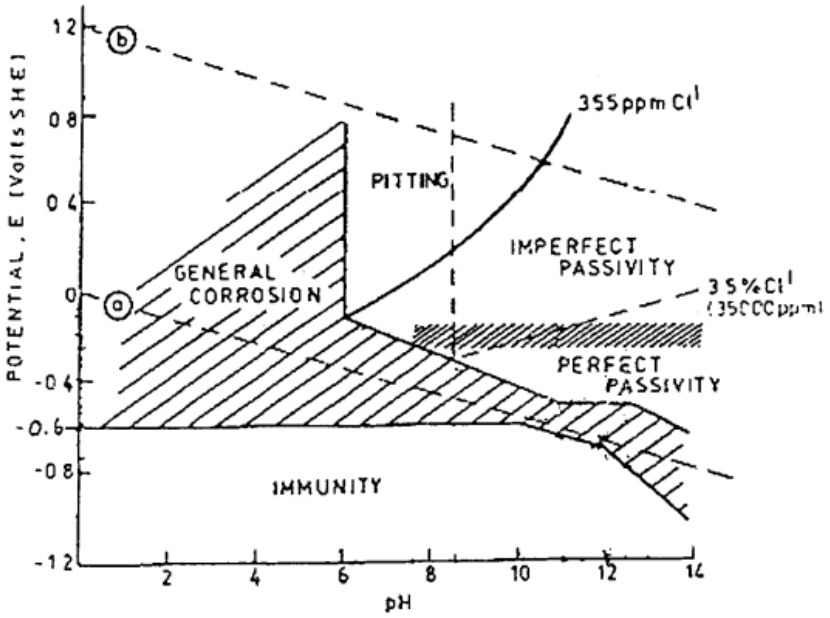

**Fig B. Effect of PH value on paasive layer & Chloride**

The corrosion reactions occurring can be represented as follows

$Fe \rightarrow Fe^{2+} + 2\ e^-$

$O_2 + 2\ H_2O + 4\ e^- \rightarrow 4\ OH^-$

$Fe^{2+} + 2\ OH^- \rightarrow Fe(OH)_2$ white corrosion product

$4Fe(OH)_2 + 2H_2O + O_2 \rightarrow 4\ Fe(OH)_3$ Red Rust

$3\ Fe + 8\ OH^- \rightarrow Fe_3O_4 + 4H_2O + 8\ e^-$ Black rust

At high chloride concentrations

$Fe + 2\ Cl^- \rightarrow FeCl_2 \rightarrow Fe^{++} + 2\ Cl^- + 2\ e^-$ Yellowish green

$O_2 + 2H_2O + 4\ e^- \rightarrow 4\ OH^-$

$6\ FeCl_2 + O_2 + 6H_2O \rightarrow 2\ Fe_3O_4 + 12H^+ + 12\ Cl^-$

Fig C & D shows a schematic illustration of the full pitting corrosion process. It is important to mention that the presence of oxygen and moisture is necessary for the precedence of corrosion process. The absence of one of them will terminate the progress of corrosion.

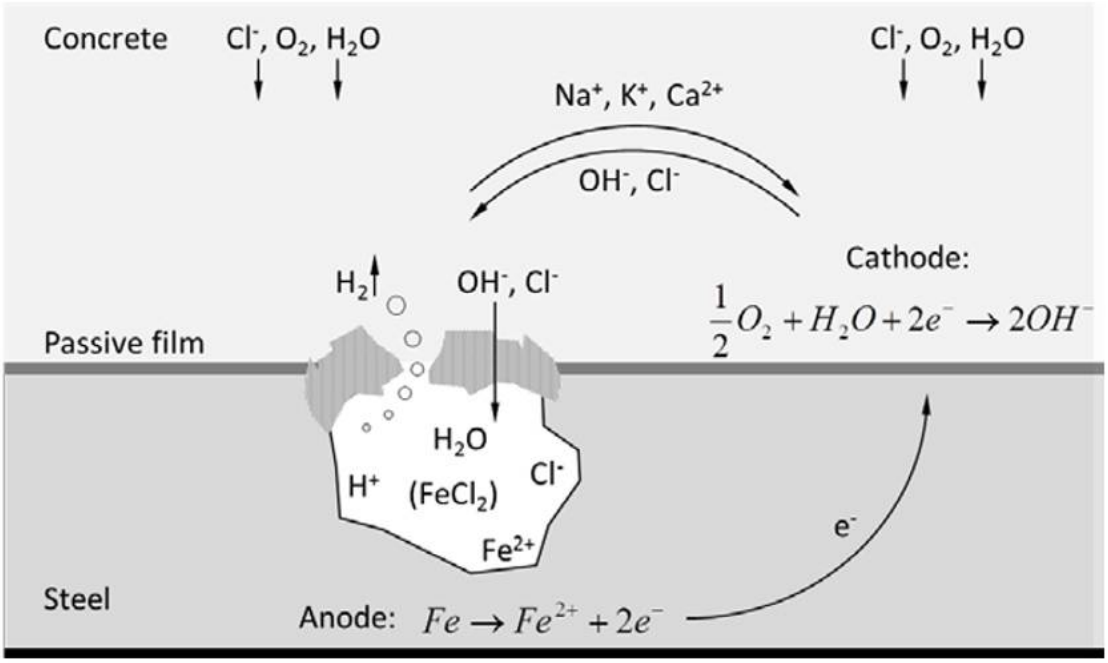

**Fig C:** When reinforcing steel corrodes, electrons flow through the bar and ions flow through the concrete.

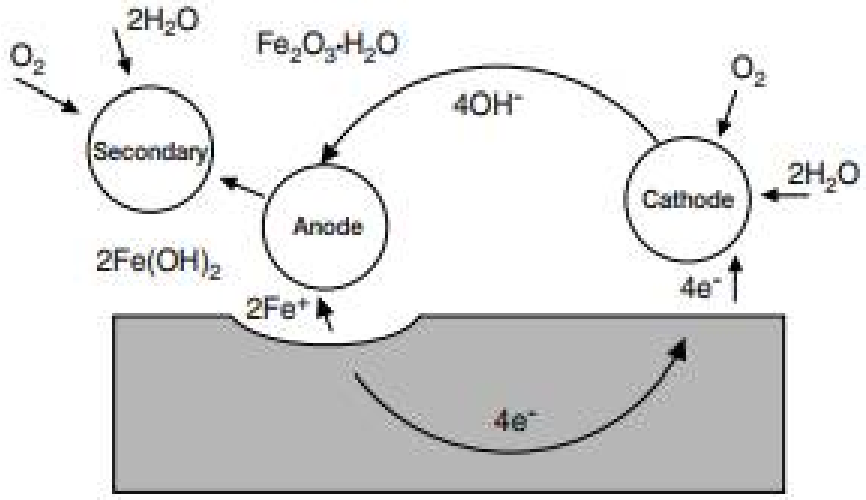

Fig D: When reinforcing steel corrodes, electrons flow through the bar and ions flow through the concrete.

## 11.5 Concrete and the Passivating Layer

Although steel's natural tendency is to undergo corrosion reactions, the alkaline environment of concrete (pH of 12 to 13) provides steel with corrosion protection. At the high pH, a thin oxide layer forms on the steel and prevents metal atoms from dissolving. This passive film does not actually stop corrosion; it reduces the corrosion rate to an insignificant level. For steel in concrete, the passive corrosion rate is typically 0.1 µm per year. Without the passive film, the steel would corrode at rates at least 1,000 times higher (ACI 222 2001). Because of concrete's inherent protection, reinforcing steel does not corrode in the majority of concrete elements and structures. However, corrosion can occur when the passivating layer is destroyed. The destruction of the passivating layer occurs when the alkalinity of the concrete is reduced or when the chloride concentration in concrete is increased to a certain level.

## 11.6 The Role of Chloride Ions

Exposure of reinforced concrete to chloride ions is the primary cause of premature corrosion of steel reinforcement. The intrusion of chloride ions, present in deicing salts and seawater, into reinforced concrete can cause steel corrosion if oxygen and moisture are also available to sustain the reaction. Chlorides dissolved in water can permeate through sound concrete or reach the steel through cracks. Chloride-containing admixtures can also cause corrosion. No other contaminant is documented as extensively in the literature as a cause of corrosion of metals in concrete than chloride ions.

The mechanism by which chlorides promote corrosion is not entirely understood, but the most popular theory is that chloride ions penetrate the protective oxide film easier than do other ions, leaving the steel vulnerable to corrosion. The risk of corrosion increases as the chloride content of concrete increases. When the chloride content at the surface of the steel exceeds a certain limit, called the threshold value, corrosion will occur if water and oxygen are also available. Federal Highway Administration (FHWA) studies found that a threshold limit of 0.20% total (acid-soluble) chloride by weight of cement could induce corrosion of reinforcing steel in bridge decks (Clear 1976). However, only water-soluble chlorides promote corrosion; some acid-soluble chlorides may be bound within aggregates and, therefore, unavailable to promote corrosion. Work at the FHWA (Clear 1973) found that the conversion factor from acid-soluble to water soluble chlorides could range from 0.35 to 0.90, depending on the constituents and history of the concrete. Arbitrarily, 0.75 was chosen, resulting in a water-soluble chloride limit of 0.15 % by weight of cement. Table 2 shows the maximum permissible water soluble chloride-ion content for reinforced concrete in various exposure conditions (ACI 318 2002). Although chlorides are directly responsible for the initiation of corrosion, they appear to play only an indirect role in the rate of corrosion after initiation. The primary rate-controlling factors are the availability of oxygen, the electrical resistivity and relative humidity of the concrete, and the pH and temperature.

3 Types and Causes of Concrete Deterioration Fig. 4. Deicing salts are a major cause of corrosion of reinforcing steel in concrete. (55807) Table 2. Maximum Chloride Ion Content of Concrete (ACI 318) Maximum Type of Member Cl-* Prestressed concrete 0.06 Reinforced concrete exposed to chloride in service 0.15 Reinforced concrete that will be dry or protected from moisture in service 1.00 Other reinforced concrete construction 0.30 *Water-soluble chloride, percent by weight of cement.

## 11.7 Volumetric expansion ratio of corrosion products

Corrosion of reinforcing steel and other embedded metals is the leading cause of deterioration in concrete. When steel corrodes, the resulting rust occupies a greater volume than the steel. This expansion creates tensile stresses in the concrete, which can eventually cause cracking, delamination, and spalling. Steel corrodes because it is not a naturally occurring material. Rather, iron ore is smelted and refined to produce steel. The production steps that transform iron ore into steel add energy to the metal. Steel, like most metals except gold and platinum, is thermodynamically unstable under normal atmospheric conditions and will release energy and revert back to its natural state—iron oxide, or rust. This process is called corrosion.

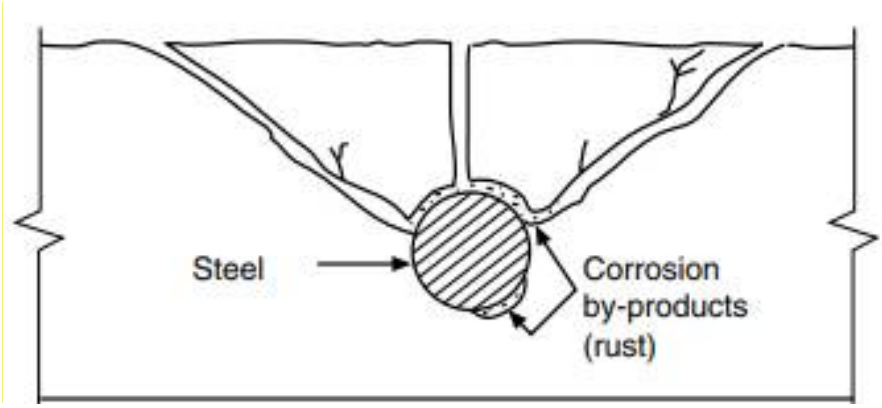

**Fig E.: The expansion of corroding steel creates tensile stresses in the concrete, Which can cause cracking, delamination, and spalling.**

The amount of volume increase in corroding reinforcing bar varies according to the types of oxidation products. Table. B presents values of the volumetric expansion ratio reported by Oh et al. (2009), Takaya et al. (2012), Mehta and Monteiro (1997) and Suda et al. (1993). This summary indicates that the product of Calcium Iron Oxide (III) Chloride is observed only in the electrically induced corrosion with the presence of chloride ions, and its volumetric expansion rate is 6.9 (Takaya et al. 2012). This product not only has a higher volumetric expansion ratio but also is the agent which has much to do with the kinematics of corrosion gel. In the range of 10 - 15 mM/l chloride, iron solubility at PH ~ (12-13) increases abruptly from near zero to 170 to 180 mM/l (Sagoe-Crentsil and Glasser 1989). This chloro-complex, where iron and chloride ions are bound together, is observed to migrate away from the

corroding steel bar and subsequently precipitate in oxygen-rich areas, releasing the chlorides to transport more ferrous ions from the corrosion steel (Sagoe-Crentsil and Glasser 1989). These facts highlight that the approaches based solely on a single volumetric expansion ratio may not be realistic to simulate corrosion induced damage of structural concrete for all conditions. These are because the degree of volumetric expansion may reach up to 5 times even more for the electrically accelerated cases in the presence of chloride ion. Here, the authors use different expansion ratio depending on the method adopted to induce corrosion and depending on the presence or absence of chloride ions.

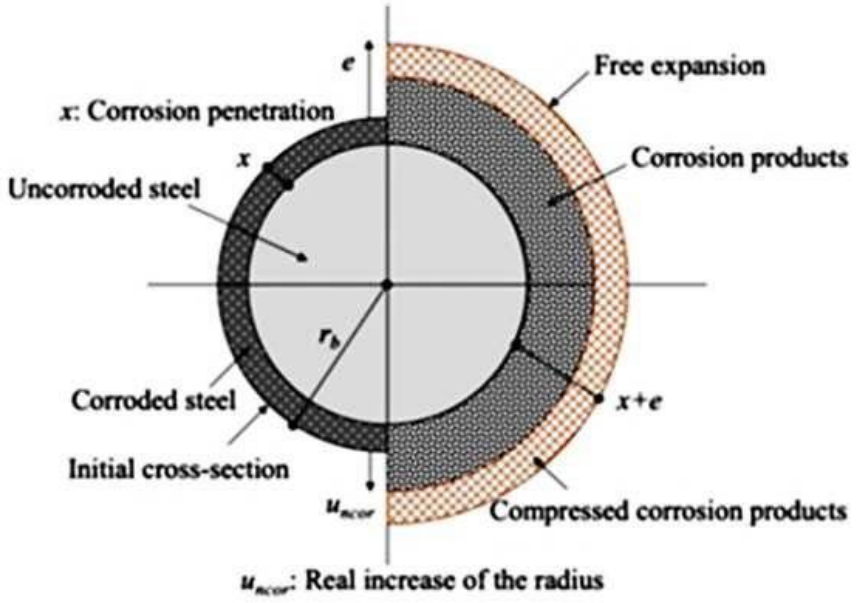

**Fig F.: The expansion of corroding & Volumetric change**

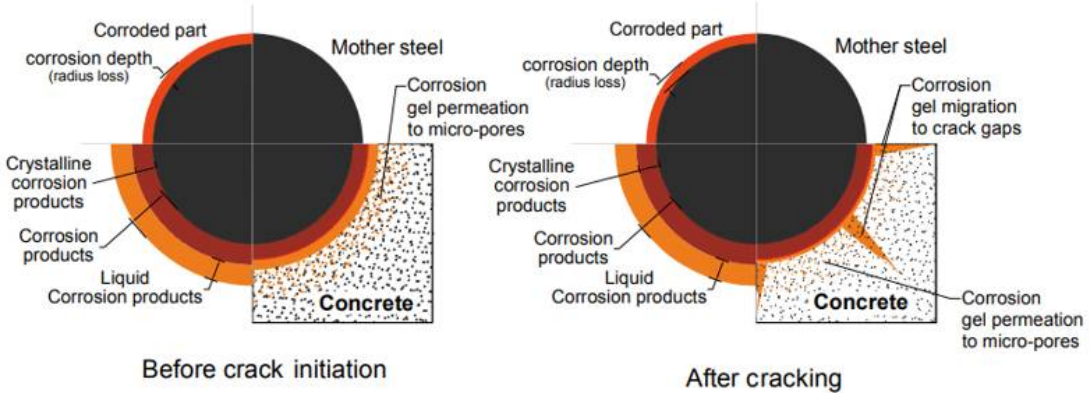

Fig.G Crystalized and Liquid Phases of corrosion products in Chloride Environment

**Table. B Volumetric change ratio of rust products**

| Corrosion products | Expansion ratio Mehta/Oh | Corrosion products | | Expansion ratio Suda* | Expansion ratio Takaya** |
|---|---|---|---|---|---|
| FeO | 1.20/1.70 | Goethite | α-FeOOH | 2.9-3.8 | 2.9 |
| $Fe(OH)_2$ | 3.75/3.60 | Akaganeite | β-FeOOH | -- | 3.5 |
| $Fe_2O_3$ | 2.20/2.10 | Lepidocrocite | γ-FeOOH | 3.0 | 3.1 |
| $Fe_3O_4$ | 2.00/2.00 | Magnetite | $Fe_3O_4$ | 2.1 | 2.1 |
| $Fe(OH)_3$ | 4.20/4.00 | Calcium Iron Oxide (III) chloride | $CaFeO_2Cl$ | -- | 6.9 |
| $Fe(OH)_3.3H_2O$ | 6.40/6.15 | Iron chloride Hydroxide | $Fe_6Cl_{2-x}(OH)_{12+x}$ | -- | NA |

## 11.8 Fick's Law & Corrosion

Typically, the initiation phase is much longer than the propagation phase. Therefore, predicting the duration of initiation phase is important in predicting the overall service life of a concrete structure. During the initiation phase, the chloride ions in the surrounding environment penetrate through the cover concrete and reach the reinforcement. As the concentration of accumulated chlorides at the reinforcement reaches a particular level (defined as the chloride threshold level or $C_{th}$), the corrosion is initiated. It has been identified the concrete cover depth (x), chloride diffusion coefficient (D) and chloride threshold ($C_{th}$) as the key parameters affecting the corrosion initiation time ($t_{initiation}$). Typically, the chloride penetration into concrete is described through diffusion phenomenon. Fick's 2nd law (Crank 1975) is commonly used to predict both steady and non-steady state migration of chloride ions in a porous medium such as concrete, as follows.

$$\frac{\partial C(x,t)}{\partial t} = D\frac{\partial^2 C(x,t)}{\partial x^2} \qquad \text{Eqn.1}$$

where C- Chloride concentration,

D - Chloride diffusion coefficient,

x - depth of penetration, and

t - exposure time.

Based on this, several models have been developed for predicting the service life of concrete structures exposed to chloride environments.

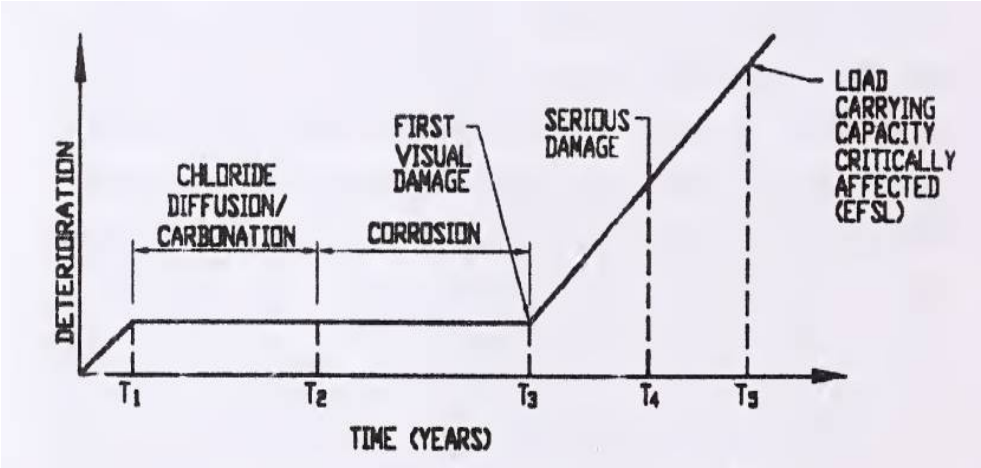

**Fig.H Time vs Deterioration –corrosion of rebars**

**Table: C Rate of Corrosion with effect of Chloride & Co2 and Relative Humidity**

| Relative Humidity (%) | Rate of corrosion in | |
|---|---|---|
| | Carbonated concrete (µm/year) | Chloride contaminated concrete (µm/year) |
| 99 | 2 | 34 |
| 95 (exposed to rain situation) | 50 | 122 |
| 90 (sheltered from rain situation) | 12 | 98 |
| 85 | 3 | 78 |
| 80 | 1 | 61 |
| 75 | 0.1 | 47 |
| 70 | 0 | 36 |
| 60 | 0 | 19 |
| 50 | 0 | 9 |

## 11.9 Threshold value of chloride in RC structure

Corrosion first begins when a certain chloride concentration has been reached around the steel. This concentration is called the threshold value. From this critical analysis of the threshold limit of chloride, it is concluded that the CI-/OH- ratio is not the appropriate index to predict rebar corrosion under all conditions. Other environmental parameters like alkalinity, oxygen availability and impermeability do play a significant role besides the CI-/OH- ratio.

Experiments carried out in the laboratory by exposing two grades of 1 concrete (lean mix concrete, rich mix concrete) to immersed conditions (seawater, potable water) and exposure conditions (indoor and outdoor weathering) revealed that in the case of lean mix concrete even though the CI-/OH ratio is found to be less than 0.6, severe corrosion occurred. On the other hand, in the case of rich mix concrete even though the $CI^-/OH^-$ ratio is found to be greater than 0.6, a negligible amount of corrosion was observed. In the case of the lean mix concrete, apart from the CI-/OH-ratio, porosity and low alkalinity also induce corrosion. On the other hand, in the case of the rich mix concrete, apart from the CI/OH- ratio the denser mix reduced the permeability of aggressive ions. The availability of oxygen at the steel surface is severely restricted by the low permeability of the rich mix concrete. Thus lean mix concrete decreases the threshold level of chloride, whereas rich mix concrete increases the threshold level of chloride to induce rebar corrosion.

Threshold Value of chloride content is expressed as a percentage on the basis of the weight of cement because cement constituents like calcium oxide and aluminium oxide play a major role in converting chloride from the Free State to the complexing state. In contrast, in the case of core samples collected from bridges and structures chloride content is expressed as a percentage on the basis of the weight of concrete as it is very difficult to find the cement content in existing structures. But from a corrosion point of view, only the free chloride content, not the total chloride content, is responsible for inducing rebar corrosion. In estimating the chloride content in concrete core samples, only the chloride content at the steel/concrete interface plays a major role in inducing passivity. But it is also very difficult to estimate the chloride content at the steel and concrete interface. Microelectrodes should be developed on the basis of ion elective electrodes to estimate the chloride content at the steel and concrete interface, because the steel and concrete interface plays a major role in identifying the active/passive condition of steel rebars. A literature survey carried out on the threshold limit of chloride to induce rebar corrosion in bridges and concrete structures revealed that various factors in the design stage itself as well as during prolonged exposure influence the quantity of chloride required to destroy passivity and induce rebar corrosion.

The following are the main factors influencing the threshold value of chloride in the design stage itself:

a. Type of cement
b. Quantity of cement
c. Source/Quality of aggregate
d. Admixtures (if any)
e. Proper Mix Design
f. Diffusion coefficient of Chloride
g. Curing Period & Type of curing
h. Concrete Cover Thickness
i. Porosity / voids in the concrete
j. Compaction of concrete
k. Water Quality & W/C ratio
l. Degree of Compaction of Concrete
m. Environmental Condition/ Exposure

Even though a high level of alkalinity remains around the steel embedded in concrete, the chloride ions can locally depassivate the steel and promote rebar corrosion. Depending upon the environment the threshold limit will vary, if the chloride content exceeds the threshold value, suitable preventive measures may be implemented to enhance the service life of RC structures.

## 7.10 Service Life Prediction Models

### 7.10.1 Bazant's model

Bazant proposed a Prediction Models have been established to foresee and evaluate basic service life in view of material resistance and external loads because of aggressive environment. The service life of a structure is characterized as the time of time after establishment until such time when expensive repair gets to be essential. For RC structures in marine situations, the resistance of concrete to chloride actuated degradation to a great extent controls its long haul strength execution. Concrete weakening because of chloride-induced deterioration can be explained to by a basic service life model comprising of an initiation (start) stage and propagation (spread stage) demonstrated in Fig.J. The initiation stage is the time from starting introduction

until depassivation of steel in concrete. This is to a great extent subject to the rate at which chlorides enter into cover concrete. The propagation stage is the time from the onset of steel corrosion until a noticeable splitting of cover concrete or first spalling. Many engineers and researcher have related service life of RC structures basically with the initiation stage, to keep up auxiliary security and serviceability, worthy appearance, and without needing to bring about unforeseen high expenses for repair. The critical time $t_{cr}$, the time at which concrete cover spalls because of corrosion & is assumed to be the sum of depassivation time ($t_p$) and propagation period or corrosion period ($t_{cor}$). The most critical degradation component of these structures is chloride affected reinforcement corrosion, which eventually prompts loss of mechanical properties of the structure.

A conceptual model for service life prediction of corroded RC structures is developed by Tuutti (Fig.J). According to this model, there are two distinct periods in deterioration caused by corrosion. The first is the corrosion initiation and second is the propagation period.

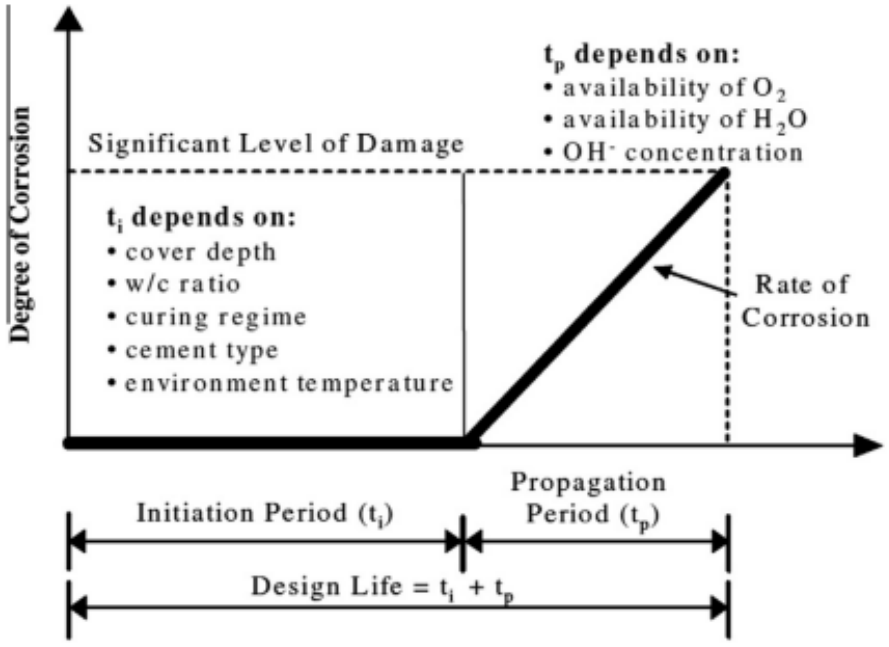

**Fig J. Service life model of corroded structures (Tuutti, 1982)**

Bazant et al. proposed a numerical model for reinforcement corrosion in concrete, to assess the time to corrosion that may lead to splitting of cover concrete. The damage because of corrosion considers the volume of expansion because of the arrangement of hydrated rust over the remaining rebar center. This red rust is expansive in nature and involves four times the volume of parental steel. Subsequently a uniform spiral weight is applied on to the encompassing concrete bringing about outward radial pressure exerted on concrete. This radial pressure is same as the increment in distance across DD of the rebar, and increments with an increase in the volume of rust till the spread solid (cover concrete) splits. As per Bazant's model, the time to cover cracking is a component of corrosion rate (Eqn.2), spread profundity, separating (spacing) or perimeter of the rebar and these are the most significant parameters.

$$t_{cor} = \rho_{cor} \frac{D\Delta D}{pj_r}$$ Eqn.2

Here, $t_{cor}$ -steady state corrosion or propagation period (years).

$\rho_{cor}$ - combined density factor for steel and rust-3600 kg/m3 .

D -Diameter of rebar (mm).

$\Delta D$ - increase in diameter of rebar due to rust formation (cm).

P - Perimeter of bar (mm).

$j_r$ - instantaneous corrosion rate of rust (g/m2 -s)

$$j_r = \frac{W}{F} i_{corr}$$ Eqn.3

Where W - Equivalent weight of steel (rust) = 27.925.

F - Faradays constant = 96,847C.

$i_{cor}$ $_r$- Corrosion current density (lA/cm2

The critical time $t_{cr}$ at which corrosion would produce cracks through the whole cover is given by Eq. 4

$$t_{cr} = t_p + t_{cor}$$ Eqn.4

Where $t_p$ - the time of depassivation (years).

$t_{cor}$ - steady-state corrosion period (years).

The passivation time (Bazant et al.) which may be calculated Eqn.5 from diffusion of chloride ions and $t_{cr}$ is calculated from Eqn.4

$$t_p = \frac{1}{12D_{app}}\left(\frac{L}{1-\sqrt{\frac{C_{th}}{C_s}}}\right)^2 \qquad \text{Eqn.5}$$

Where L - cover thickness (mm).

$C_{th}$ - the threshold value of the chloride concentration (kg/m3 of concrete).

$C_s$ - the concentration of chloride ions in pores of concrete at the surface ($Kg/m^3$ of concrete).

$D_{app}$- apparent chloride diffusion coefficient (cm2 /s).

The same formulation is adopted to calculate the depassivation time and critical time of cracking for the other models to predict the service life

### 7.10.2 Morinaga's Model

Morinaga suggested a simplified mathematical model to register the measure of corrosion ($Q_{cr}$) of steel in cement, when concrete cover breaks because of expansion of rust development on the surface of the rebar. The damage due to corrosion considers the volume of expansion because of the development of hydrated rust over the left over rebar center. Corrosion rate is the most noteworthy parameter in deciding the time to cracking of the spread concrete. The time from start of corrosion to cover cracking is a component of corrosion rate, solid clear cover, and steel bar distance across (Morinaga, 1988). It is apparent that the experimental mathematical statement does not represent the mechanical properties of concrete which would altogether influence the time to cover cracking. Refer Eqn.6.

$$Q_{cr} = 0.602D\left(1+\frac{2C_V}{D}\right)^{0.85} \qquad \text{Eqn.6}$$

Where, $Q_{cr}$ - amount of corrosion when concrete cracks ($10^{-4}$ g/cm$^2$).

$C_v$ - concrete cover thickness (mm).

D - diameter of rebar (mm).

The duration of steady state corrosion, $t_{cor}$ corresponding to $Q_{cr}$ can be obtained as:

$$t_{cor} = \frac{Q_{cr}}{j_r}$$

Eqn.7

Where, Jr - instantaneous corrosion rate (g/m$^2$ -s)

### 7.10.3 Wang and Zhao's Model

Wang and Zhao have recommended a stage technique for utilizing limited component examination to focus the thickness of the corrosion product, D, comparing to the time term when the surface concrete cracks. Further by breaking down an extensive number of rebar corrosion information gathered from research facility and contrasting them and the aftereffects of limited component examination, the researchers established an exact expression to focus the proportion of thickness of corrosion product, D, to the penetration depth of the rebar H, comparing to the crack in spread concrete. The ratio (D/H) Eqn.8, has been communicated as a component of concrete cube strength fcu, as:

$$\frac{\Delta}{H} = 0.33\left(\frac{D}{C_V}\right)^{0.565} f_{cu}^{1.436}$$

Eqn.8

Where, D-diameter of reinforcing bar (mm).

Cv- Cover thickness (mm).

fcu- Cube strength of concrete (kN/cm2 ).

D- Thickness of corrosion product (cm).

H- Cracks in concrete cover.

Using the value of D obtained, the estimation of H relating to cracks in cover concrete can be obtained. Further the estimation of H can be utilized to focus the time essential for longitudinal cracking of cover concrete, $t_{cor}$

$$t_{cor} = \frac{H}{p_r}$$

Eqn.9

where $p_r$ - penetration rate of rebar due to corrosion can be calculated from

$$p_r = \frac{W}{F\rho_{st}} i_{corr}$$

Eqn.10

Where $W$ -equivalent weight of steel = 27.925

F -Faraday's constant = 96,847C

$i_{corr}$ -Corrosion current density ($\mu A/cm^2$)

$\rho_{st}$ -Density of steel ($kg/m^3$)

### 7.10.4 IV- IRC Model

Corrosion propagation time is being evaluated due to falling pH (IRC). The reason for the falling pH is by process of carbonation, or as a consequence of chloride substance transcending the limit near to the reinforcement. Some guiding expressions are available in the IRC-SP60 to determine the propagation time. If there should arise an occurrence of generalized corrosion, the basic loss of bar span is in view of the cover cracking. The propagation (cracking) time can be inexact by the accompanying formula, Eqn.11

$$t_r = \frac{80C}{Dr}$$

Eqn.11

Where, C -the thickness of the concrete cover (mm).

D -the diameter of the reinforcing bar (mm).

r -rate of corrosion (µm/year).

$t_r$ -steady-state corrosion (years).

The rate of corrosion in concrete can be evaluated using the Eqn.12

$$r = c_T r_O$$ Eqn.12

Where $c_T$ -the temperature coefficient.

$r_O$ -the rate of corrosion at +20 C

Because of exposure to the salt water in the coastal regions, concrete bridges are contaminated with chlorides. The presence of chlorides (resulting in the loss of alkaline environment), oxygen and water lead to corrosion of embedded steel. Chloride ions diffuse through the porous concrete and reach the corrosion threshold value. The resultant cracking of concrete cover allows intrusion of chlorides and oxygen at a much faster rate, thus accelerating the corrosion process. Existing chloride in concrete is not considered in the following expression. As a result of chloride penetration a gradient is set up near the concrete surface. The time at which the critical chloride content reaches the steel surface and de-passivates it, is regarded as the initiation time of corrosion.

### 7.10.5 Carslaw and Jaeger Model

The closed-loop solutions provided by Carslaw and Jaeger (1947) for the Eq. (1) (for various boundary conditions) have been commonly adopted for predicting chloride migration in concrete, with a set of assumptions.

- Concrete is a semi-infinite, porous, homogeneous and isotropic material.
- No reactions thought to occur between the concrete and diffusing species (chlorides).
- C(x, t) = 0 when t = 0 and x > 0
- C(x, t) = f(t) when x = 0 and t > 0 Carslaw and Jaeger (1947) have provided solutions for three different boundary conditions. For example, when surface chloride concentration is constant, i.e., f(t) = C0, the solution is,

$$C(x,t) = C_i + (C_s - C_i) \cdot erfc\left(x/\sqrt{4Dt}\right)$$ Eqn.13

Where, C(x, t) - chloride concentration at depth x after exposure time t,

Ci - initial chloride concentration at depth x (t = 0),

Cs - constant surface chloride concentration (at any given time),

erfc - complementary error function.

The solutions for two other boundary conditions (i.e., f(t) = k· t and f(t) = k·√t, where k is a constant), along with the equations for Life-365 Model

Fig. K indicates the effect of concrete cover and diffusion coefficient of chloride and chloride content on corrosion initiation time.

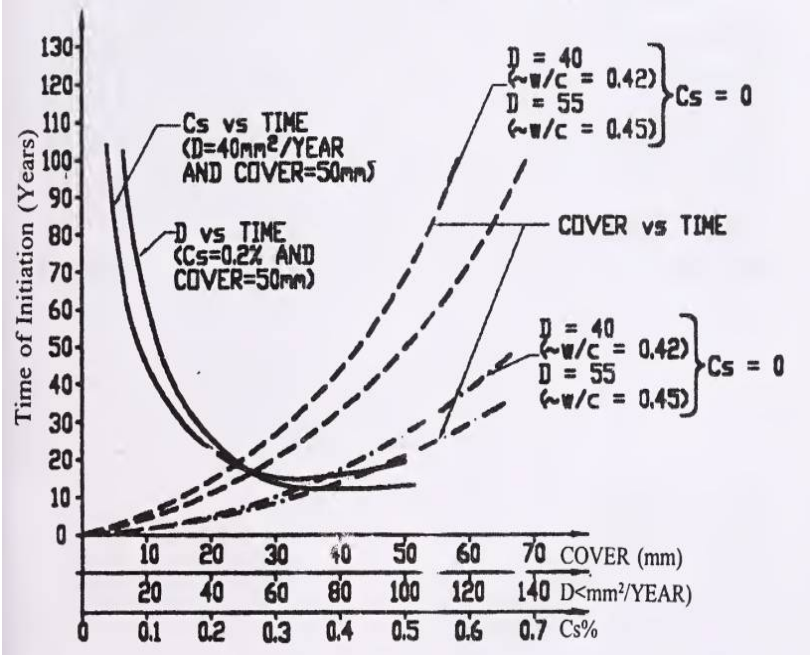

**Fig. K Effect of Cover & Diffusion coefficient on Corrosion initiation**

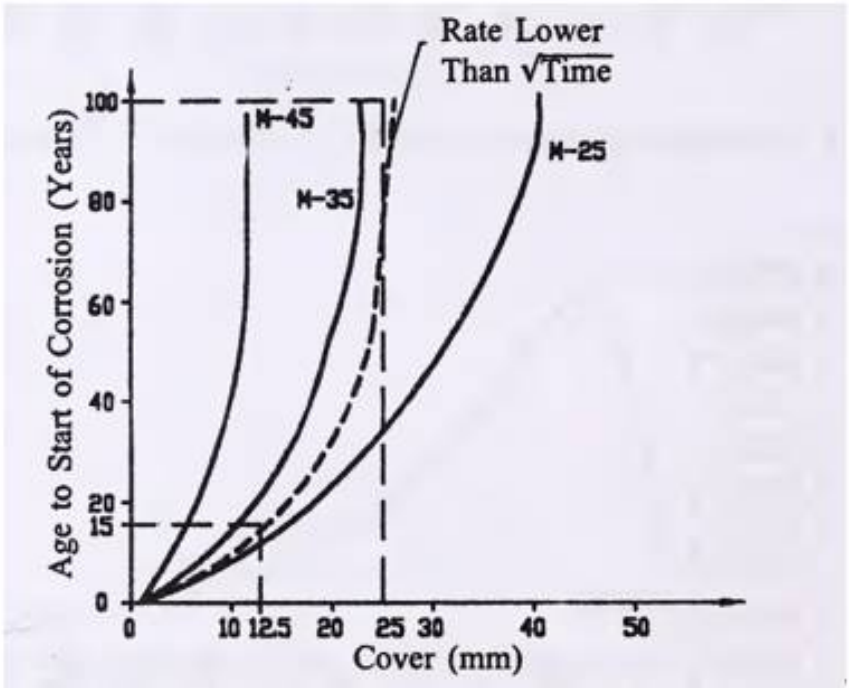

**Fig. L Effect of Cover on Corrosion initiation by carbonisation**

Fig.L indicating the age to start corrosion due to carbonation in various grades of concrete. Yet another study 7 observes that carbonation and chlorides can penetrate to the interior of concrete at a lower rate than would be given by a square-root of time function. This means that if the concrete cover is halved, the critical state for incipient danger of corrosion will be reached in less than a quarter of the time.

**We have adopted IRC Model in evaluating the corrosion periods.**

## Extending Life of structure with Regular Maintenance & Repair

There are various factors contributing for durability of structure and degradation of structure.

Corrosion of reinforcing steel and other embedded metals is the leading cause of deterioration in concrete. When steel corrodes, the resulting rust occupies a greater volume than the steel. This expansion creates tensile stresses in the concrete, which can eventually cause cracking, delamination, and spalling. Steel corrodes because it is not a naturally occurring material. Rather, iron ore is smelted and refined to produce steel. The production steps that transform iron ore into steel add energy to the metal. Steel, like most metals except gold and platinum, is thermodynamically unstable under normal atmospheric conditions and will release energy and revert back to its natural state—iron oxide, or rust. This process is called corrosion.

Fig.M represents the acceptable performance level of the RC building and if the performance level falls below the acceptance level, it shall be repaired / restored to its original strength. The extension of service life of structure depends on the method of repair /strengthening method adopted. Fig.N depicts the first repairs/ strengthening applied when the performance of building reaches non acceptable level due to degradation concrete and extended service life of the Building. T1 is the age building from the construction and R1 is the First repair done in view of performance reaching non acceptable level, the service life of the structures extended from L1 to L2. The repairs can be applied with proper condition evaluation of the existing building and carrying out the analysis and design of the building with degradation impact.

Repair methods can be applied as proposed by the consultants. The extended service life of the building depends on work done on strengthening methods and regular maintenance of the building after strengthening.

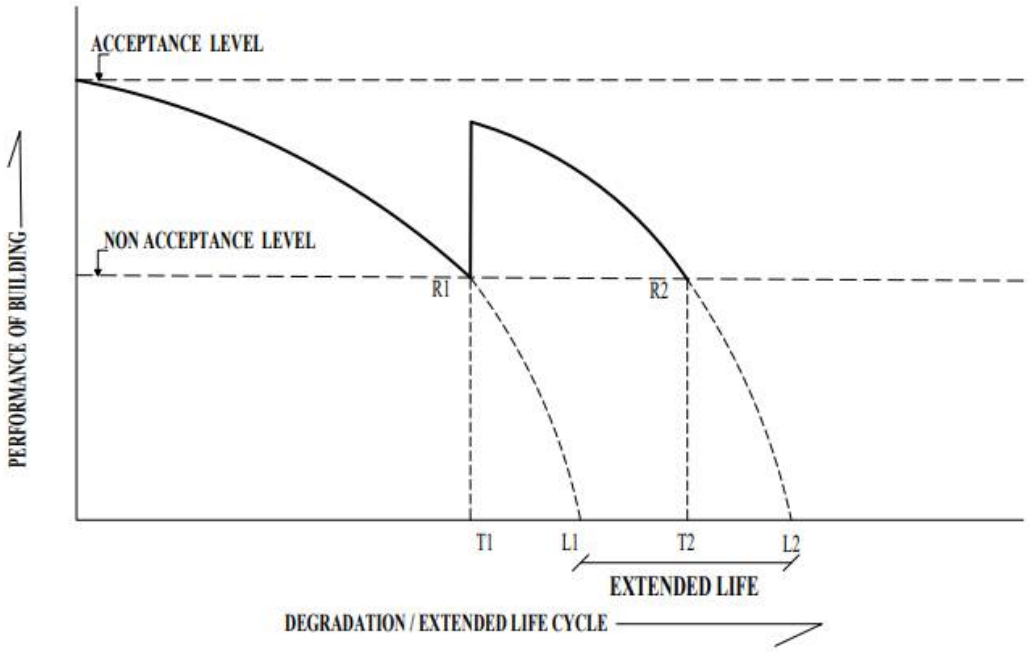

**Fig.M Extended service life with repair/strengthening**

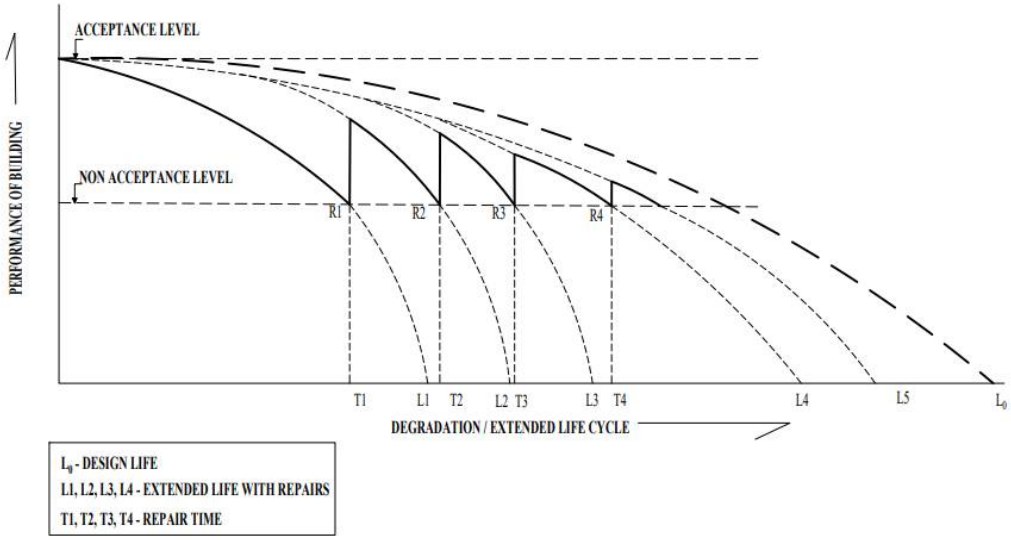

**Fig.N Extended service life with repair/strengthening, poor maintenance and `multiple repairs**

It was reported that, Tower C was built in year 2017-18, distress in the building with cracks and spalling of concrete observed with in the 5 yrs age of structure. The corrosion initiation may have occurs in the first 2 to 3 Yrs and propagation of corrosion have taken place in 3 to 5 yrs, resulted in the de-colouring of concrete along the reinforcement, Cracking of concrete and Spalling of concrete.

The main causes of distress in the various Structural Elements of Tower C are due to

1. Lesser Cover for Structural elements
2. Appropriate Exposure Condition is not considered in the design
3. Actual compressive strength of concrete in the structural elements are less than the design strength of concrete,
4. Use bore water for curing with chloride contaminated water for curing (information given by RWA)
5. Poor Quality Control
6. Concrete Pour Card Not available, issue with strength of concrete poured
7. Quick action against degradation (strengthening) measures is not done

**Table D. Depicts the cover provided for the various structural elements**

| Structural Component | Cover in GFC | Cover as Per IS code 456 | Status | Remarks |
|---|---|---|---|---|
| Piles | 75mm | 75mm | Okay | Severe Exposure Condition , Table 16, IS 456 |
| Pile Cap | 75mm | 75mm | Okay | |
| Columns & Shear Wall | 35mm | 45mm | Not Okay | |
| Beams | 30 | 45 | Not Okay | |
| Slabs | 30 | 45 | Not Okay | |
| Staircase Waist Slab | 30 | 45 | Not Okay | |

**Table E Extended service life with proposed strengthening of distress elements - Tower C**

| Tower C | Year | Age | Remarks |
|---|---|---|---|
| Design Life | 50 Yrs | 50 yrs | As per Euro Code 01- CEN 1994, IRC SP60 |
| Constructed Date | 2014 | 0 | |
| Age at Visible Cracks | 2021 | 4.5 | As per the information gathered from RWA |
| Continued Distress | 2023 | 3 | After Visible Cracks |
| Application of Strengthening of Distress members | 2023-24 | 1yrs | |
| Extended Service Life | | 28 -30yrs | With proposed strengthening & regular maintenance, further degradation shall be reduced. Repairs shall be applied at time, when the performance level will fall below the Non-acceptance level. The original service life of the structure cannot be obtained. |
| Current Service life without strengthening | | 8- 10 yrs | The building is in aggressive environment, the present distress level will increase in view of increase in corrosion of rebars with age of structure. Without any strengthening, with increase degradation (strength of concrete and rebar) the structural capacity of the member reduces. Failure of any one structural element/multiple element will lead to progressive collapse of the building |
| Repetition of strengthening | | Yes | The building is in aggressive environment, periodic maintenance and strengthening will be required |

## Important Note & Caution

Extended Service life of Tower-C depends on the following, However, BV do not have any binding/ responsibility on quality of restoration work to be carried out on the structure:

1. The assumption made in the reduction of diameter of the Main bar is based on the corroded bars exposed and the actual compressive strength of the concrete in all the structural element shall be M25 in view of degradation and NDT results.
2. *The IS code prevailing during construction of the building Tower C are used in evaluation, IS 1893-2002 & IS 13920 -1993 are used together with other relevant codes*
3. The Strengthening Methodology proposed shall be strictly followed & no deviation

4. All Strengthening work shall be executed by experienced and skilled retrofitting consultants/contractors.
5. All the Strengthening work shall be monitored and quality assurance shall be established by a technically competent and experienced consultants in strengthening of RC degraded structures due to corrosion of rebars.
6. All Strengthening sequence shall be approved by the Structural consultant.

## 8.0 INFERENCES.

Following are the inferences drawn, based on the detailed observations and results of probing tests.

8.1 From the results of Ultrasonic pulse velocity test, it is inferred that the quality of concrete in the tested Common Basement floor RC members & RC members of Tower-C fall under the category of "**Doubtful to Good concrete".**

8.2 From the results of Rebound Hammer test, it is inferred that the estimated strength of concrete nearer to surface /surface hardness of tested Common Basement floor RC members & RC members of Tower-C is found to be **satisfactory**.

8.3 From the observations of extracted concrete core samples, it is evident that the extracted samples are uniform, homogeneous and free from voids/honeycombs. From the concrete core test results, it is indicated that the quality/strength of concrete in the tested Common Basement floor RC members & RC members of Tower-C is found to be **satisfactory.**

8.4 From the results of the Half-Cell Potential Measurement Test, it is inferred that the probability of corrosion fall in the category "**Uncertainty of Corrosion to High Probability of corrosion" i.e., Moderate to Advance stage of corrosion** in the tested Common Basement floor RC members & RC members of Tower-C.

8.5 From the results of the carbonation test, it is inferred that the **carbonation front has reached up to reinforcement level** from the surface in most of the tested Common Basement floor RC members & RC members of Tower-C.

8.6 From the results of the Chloride content test, it is inferred that the level of chloride content in the tested concrete samples of Common Basement floor RC members & RC members of Tower-C is **beyond the permissible limit** of 0.6 kg/cum in some RC members and within the limits in some RC members.

8.7 From the results of the Sulphate content test, it is inferred that the level of sulphate content in the tested concrete samples of Common Basement floor RC members & RC members of Tower-C is **within the permissible limit** of 4%.

8.8 From the results of pH value, it is evident that the pH value is found to be **with-in the desired value** in most of the tested concrete samples of Common Basement floor RC members & RC members of Tower-C is in the desired range.

8.9 From the results of the water test, it is evident that the water below the grade slab/flooring does not confirms to requirements of IS 456: 2000 for plain/ reinforced concrete construction.

8.10 Cracks, spalling of concrete and exposure of rebar are essentially due to corrosion of embedded rebars. The reasons for corrosion in RC members may be due any one or combination of reasons listed below.

- **Very less cover provided for RC members.**

  As per clause 8.2.2.1 (Environmental Exposure Condition) and 26.4.2 (Nominal Cover to Meet Durability Requirement) of IS 456: 2000 minimum cover to be maintained in **"Severe"** (Coastal Environmental Exposure Condition) is 45mm.

- **Presence of inbuilt high chloride content in concrete due to**

1. Use of high chloride content water during construction i.e. Mixing and as well as curing.
2. Use of adulterated aggregates

- **Ingress of moisture into RC members.**

  This is due to leakage of water from roof slabs, seepage from retaining walls, stagnation of water and inadequate slope in RC members.

- **Carbonation of concrete.**

  Considering the age of the concrete the depth of carbonation in the affected members is more than expected.

8.11 Repairs carried for distress regions of RC members to arrest corrosion were observed to be executed without providing shear connector, mechanical anchors and weld mesh which may lead to de-bonding of concrete/cracks over a prolonged period. This needs appropriate corrective action to enhance the durability and serviceability of the structure.

8.12 Corrosion of rebars in RC members at expansion joint region & Pipe duct region is essentially due to continuous leakage of water & inadequate thickness of cover concrete.

8.13 Seepage of water in/through the retaining wall is essentially due to very high water table in the vicinity of the apartment/area.

8.14 Seepage/Leakage & damp patches in peripheral retaining walls on the basement floor are essentially due to in-effective waterproof treatment on exterior side or positive side and at the junctions of the wall/the construction joint regions of the wall. Added to it, ineffective surface drainage system at the ground level leading to ingress/seepage of water into the basement through retaining walls.

8.15 The drainages at podium level are having undulations/reverse slope leading to stagnation and seepage of water. **Note:** No records were available regarding the treatment carried out on the exterior face of the retaining wall.

a) Stagnation of water over roof slab is essentially due to improper/inadequate slope provided

for disposal of rainwater.

b) Cracks in pavement concrete is due non provision of groove for thermal expansion.

c) Dampness/damp patches and peeling of paint in the basement ceiling slab is essentially due to leakage of water.

8.16 Based on analysis with and without distress of structural elements as detailed in theoretical analysis and design shear wall S1 to S36 requires strengthening, on the other hand columns, beams and slabs with degradation found to be adequate to withstand the expected loads. The strengthening of columns, beams and slabs is required in view of corrosion of rebars and strength of concrete less than designed strength. The minimum grade of concrete for strengthening of structural elements shall be M40.

8.17 Based on IRC model Service life of the structure is evaluated with degradation due to corrosion rebars and expected extended service life of structure with strengthening of distressed members are furnished.

## 9.0 RESTORATION/CORRECTIVE MEASURES.

Based on the above detailed studies & inferences drawn, appropriate recommendations are made

### 9.1 Providing concrete encasement for severely corrosion distressed RC Columns.

**Sequence of operations:**

a. Temporary support shall be provided to adjoining beams/slab around the column at a distance of 1.0 m from the column face using appropriate props for effective transfer of load.

b. Infilled walls if any, on either side of the column of about 500 to 750 mm shall be completely removed for the entire height from top to bottom

c. The existing plaster and loose cover concrete in columns shall be removed thoroughly by gentle chipping and cleaned with a wire brush and water jet.

d. The exposed reinforcement shall be cleaned thoroughly using a mechanical wire brush/ buffing wheel followed by a water jet to remove corrosion scales.

e. Sacrificial zinc anode shall be provided as per standard practice and manufacturers specification.

f. Severely corroded rebars (if any) shall be replaced by same diameter rebar through welding.

g. Exposed concrete surface shall be provided with corrosion inhibitor solution using a

pneumatic sprayer as per manufacturer's specification.

h. The cleaned surface of the exposed reinforcement shall be provided with two coats of anti-corrosive chemical as per the manufacturer's specification.

i. 16 mm dia, 100 mm deep holes shall be drilled at 300 mm c/c (staggered) for fixing shear connectors and the drilled holes shall be thoroughly cleaned to remove dust particles using air and water jet.

j. 12 mm dia shear connectors shall be fixed in drilled holes using polyester resin anchor grout as per manufacturer's specification.

k. Appropriate dia holes shall be drilled in the beam/slab/grade-slab to insert proposed column bars.

l. 10mm dia holes shall be drilled in the RC wall to insert ties @ 200c/c (if applicable).

m. Proposed rebars column bars (with two coats of anti-corrosive chemical coating) shall be fabricated, placed in position and tack welded to shear connectors as detailed in sketch.

n. 8 or 10mm dia ties @ 200c/c shall be provided or fixed in drilled holes using anchor grout as per standard practice (if applicable).

o. 100/75 mm dia through holes shall be made in RC slab at column junctions to facilitate pouring free flow micro concrete.

p. Specified thick (as per schedule), non-shrink, free flow, self-compacting concrete encasement shall be provided using slurry tight shuttering as per specification enclosed.

q. The encased concrete shall be cured for a minimum period of 7 days as per standard practice.

**(Refer sketch DWG.REF. No.RM-01, 02, 17, 18)**

## 9.2 Providing concrete encasement for severely corrosion distressed RC Beams.

**Sequence of operations:**

a. Temporary support shall be provided to adjoining slab around the beam using appropriate props for effective transfer of load.

b. The existing plaster and loose concrete in beams shall be thoroughly removed by gentle chipping and cleaned using a mechanical wire brush and water jet.

c. The exposed reinforcement shall be cleaned thoroughly using the mechanical wire brush/ buffing wheel followed by a water jet to remove corrosion scales, loose particles, etc.

d. Sacrificial zinc anode shall be provided as per standard practice and manufacturers specification.

e. Severely corroded rebars (if any) shall be replaced by same diameter rebar through welding.

f. Exposed concrete surface shall be provided with corrosion inhibitor solution using a pneumatic sprayer as per manufacturer's specification.

g. The cleaned surface of the exposed reinforcement shall be provided with two coats of anti-corrosive chemical as per the manufacturer's specification.

h. 10 or 12 dia holes shall be drilled in the slab/beam to insert 8mm stirrups at 200c/c on both sides of beam exactly parallel to each other. Drilling depth shall be 100mm if stirrups needs to terminated with in the slab, through and through if the stirrups to be terminated on top of slab/beam, drilling not required if stirrups to be terminated outside/underneath the slab and held using shear connectors.

i. if the stirrups to be terminated on top of slab, about 50mm of slab concrete to removed by gentle chipping without damaging the surroundings.

j. Proposed dia, 100 mm deep holes shall be drilled at specified intervals (staggered) for fixing shear connectors and the drilled holes shall be thoroughly cleaned to remove dust particles using air and water jet.

k. Proposed dia shear connectors shall be fixed in drilled holes using polyester resin anchor grout as per manufacturer's specification.

l. Appropriate dia holes shall be drilled in the column/beam to insert proposed rebars.

m. Proposed rebars rebars bars (with two coats of anti-corrosive chemical coating) shall be fabricated, placed in position and tack welded to shear connectors as detailed in sketch.

n. 8mm dia stirrups @ 200c/c shall be provided to suit the site condition.

o. 100/75 mm dia through holes shall be made in RC slab staggered on both sides of beam to facilitate pour concrete.

p. 75mm thick, non-shrink, free flow, self-compacting concrete encasement shall be provided using slurry tight shuttering as per specification enclosed.

q. The encased concrete shall be cured for a minimum period of 7 days as per standard practice.

**(Refer sketch DWG.REF. No.RM-03A, 03B, 03C)**

### 9.3 Treatment for peripheral RC retaining wall of Basement floor to prevent seepage of water.

a. All existing plaster/de-bonded cover concrete shall be completely removed by gentle chipping to expose hard / sound concrete.
b. 'U' groove of 10 mm shall be made along the lift interface/ crack/construction joint. and filled with polymer modified mortar.
c. 12 mm dia holes, 75 mm deep @500c/c shall be drilled along the crack/joint/ honey-combed/damped surface to fix PVC nozzles for grouting.
d. 10 mm dia PVC nozzles shall be fixed into the drilled holes using anchor grout as per specification.
e. 'U' groove shall be filled with polymer modified mortar as per standard practice.
f. Pressure grouting shall be done with a pressure of 3 to 4 Kg/sq.cm using low viscous, elastic and solvent-free polyurethane injection resin grouting through the nozzles as per specification enclosed. The nozzles shall be cut in flush with the surface and plugged.

**(Refer sketch DWG.REF. No.RM-04)**

**Note:**

The above treatment is shall be carried out from the negative side. Since the observed distress such as dampness, damp patches &seepage in retaining walls are minor, it is recommended to carry out the grouting from the negative side & wait for two seasons.

If the problem still persists then, treatment shall be carried from the positive side (Since the cost implication is high in treating from positive side, it has been kept as the secondary option) as detailed below.

**OPTIONAL**

**Treatment for peripheral RC retaining wall to prevent seepage of water from positive side.**

a. Existing landscaping/paver blocks/PCC/earth filling shall be removed completely without damaging the parent concrete of retaining wall to expose the distressed/damped portion of the retaining wall.
b. The exposed concrete surface shall be inspected and checked for any surface honeycombs, cracks/distress if any.
c. The existing cracks & honeycombs in the retaining wall (if any) shall be grouted using low viscous, elastic and solvent-free polyurethane injection resin as per manufacture's specification.

d. The entire concrete surface shall be providing with water proofing plaster mixed with silica fumes and polypropylene fibers.
e. 4 mm thick APP membrane shall be provided on the plastered surface with adequate torching as per manufacturer's specification.
f. Backfilling shall be carried using approved quality soil in layers to 95% degree of compaction.
g. 100mm thick screed concrete shall be provided over 100mm thick soling with adequate slope to drain off water and avoid water entering the treated regions.

**9.4 Providing concrete encasement for severely corrosion distressed RC shear walls.**

**Sequence of operations:**

a. Temporary support shall be provided to adjoining beams/slab around the column at a distance of 1.0 m from the column face using appropriate props for effective transfer of load.
b. The existing plaster and loose cover concrete in shear wall shall be removed thoroughly by gentle chipping and cleaned with a wire brush and water jet.
c. Sacrificial zinc anode shall be provided as per standard practice and manufacturers specification.
d. The exposed reinforcement shall be cleaned thoroughly using a mechanical wire brush/ buffing wheel followed by a water jet to remove corrosion scales.
e. Severely corroded rebars (if any) shall be replaced by same diameter rebar through welding.
f. Exposed concrete surface shall be provided with corrosion inhibitor solution using a pneumatic sprayer as per manufacturer's specification.
g. The cleaned surface of the exposed reinforcement shall be provided with two coats of anti-corrosive chemical as per the manufacturer's specification.
h. Appropriate dia, 100 mm deep holes shall be drilled at specified intervals (staggered) for fixing shear connectors and the drilled holes shall be thoroughly cleaned to remove dust particles using
air and water jet.
i. proposed dia shear connectors shall be fixed in drilled holes using polyester resin anchor grout as per manufacturer's specification.
j. Appropriate dia holes shall be drilled in the beam/slab/grade-slab to insert proposed

column bars.

k. Proposed rebars vertical and horizontal (with two coats of anti-corrosive chemical coating) shall be fabricated, placed in position and tack welded to shear connectors as detailed in sketch.

l. 100/75 mm dia through holes shall be made in RC slab at column junctions to facilitate pouring non-shrink, free flow, self-compacting concrete.

m. 50mm thick, non-shrink, free flow, self-compacting concrete encasement shall be provided using slurry tight shuttering as per specification enclosed.

n. The encased concrete shall be cured for a minimum period of 7 days as per standard practice.

**(Refer sketch DWG.REF. No.RM-16)**

## 9.5 Treatment for moderately distressed regions of RC members (Locally damaged areas).

a. All loose plaster, cover concrete & patch-up regions in the RC members shall be completely removed by gentle chipping to expose hard / sound concrete surface.

b. Exposed reinforcing bars shall be thoroughly cleaned with wire brush and emery cloth or by mechanical buffing wheel to remove rust, scales etc.

c. Exposed concrete surface shall be thoroughly cleaned with wire brush followed by air and water jet to remove dust particles.

d. Sacrificial zinc anode shall be provided as per standard practice and manufacturers specification.

e. Severely corroded rebars (if any) shall be replaced by same diameter rebar through welding.

f. Two coats of anti-corrosive chemical shall be provided on the exposed and cleaned reinforcing bars as per the manufacturer's specification.

g. Exposed concrete surface shall be provided with corrosion inhibitor solution using a pneumatic sprayer as per manufacturer's specification.

j. 20 mm thick polymer modified mortar plaster to specification shall be provided (suitable to site condition) and finished in flush with the adjacent surface over a coat of primer as per manufacturer's specification and cured.

**(Refer sketch DWG.REF. No.RM-05)**

***Note:***

*a) If the thickness of structural grade polymer/latex modified mortar layer exceeds 20mm, a layer of weld mesh 50 x 50 x 3 mm shall be placed and fixed to concrete using U nails.*

*b) It is advisable to apply corrosive inhibitor solution to the entire external surface of RC members which are affected. The measures recommended in order to avoid ingress of moisture during rains, since the chloride in concrete will be active in the presence of moisture environment.*

c) *During any maintenance, it is recommended to use moisture resistant paints to RC members.*

**9.6 Treatment for distressed regions of RC slab/waist slab of staircase/Landing Beam**

a. All loose plaster, cover concrete & patch-up regions in the RC members shall be completely removed by gentle chipping to expose hard / sound concrete surface.
b. Exposed reinforcing bars shall be thoroughly cleaned with wire brush and emery cloth or by mechanical buffing wheel to remove rust, scales etc.
c. Exposed concrete surface shall be thoroughly cleaned with wire brush followed by air and water jet to remove dust particles.
d. Sacrificial zinc anode shall be provided as per standard practice and manufacturers specification.
e. Severely corroded rebars (if any) shall be replaced by same diameter rebar through welding.
f. Two coats of anti-corrosive chemical shall be provided on the exposed and cleaned reinforcing bars as per the manufacturer's specification.
g. Exposed concrete surface shall be provided with corrosion inhibitor solution using a pneumatic sprayer as per manufacturer's specification
h. Appropriate dia, 75/100 mm deep holes shall be drilled at specified intervals (staggered) for fixing shear connectors and the drilled holes shall be thoroughly cleaned to remove dust particles using air and water jet.
i. Proposed dia shear connectors shall be fixed in drilled holes using polyester resin anchor grout as per manufacturer's specification.
j. a layer of weld mesh 50 x 50 x 3 mm shall be placed and fixed to concrete using shear connectors.

k. 40 mm thick shotcrete (30mm main coat and 10mm polish coat) to specification shall be provided (suitable to site condition) and finished in flush with the adjacent surface as per standard practice and cured.

**(Refer sketch DWG.REF. No.RM-11, 10, 14 )**

**9.7 Treatment for cracks in RC Ceiling slab.**

a. All existing plaster/de-bonded cover concrete shall be completely removed by gentle chipping to expose hard / sound concrete.

b. 'U' groove of 10 mm shall be made along the lift interface/ crack/construction joint. and filled with polymer modified mortar.

c. 12 mm dia holes, 50/75 mm deep @ 200mm c/c shall be drilled along the crack/joint/ honey-combed surface to fix PVC nozzles for grouting.

d. 10 mm dia PVC nozzles shall be fixed into the drilled holes using anchor grout as per specification.

e. 'U' groove shall be filled with polymer modified mortar/ epoxy putty as per standard practice.

f. Pressure grouting shall be done with a pressure of 3 to 4 Kg/sq.cm using low-viscosity epoxy injection grouting through the nozzles as per specification enclosed. The nozzles shall be cut in flush with the surface and plugged.

**(Refer sketch DWG.REF. No.RM-07, 08)**

**9.8 Treatment for separation crack between the junction of RC member & masonry wall.**

**a.** ' U' groove of 12 mm wide 6 mm deep shall be made all along the crack at the interface of masonry wall and RC member junction and cleaned.

b. Groove shall be filled with a flexible sealant like Tacksel/Polysulphuide sealant /silicon sealant or any other equivalent.

**(Refer sketch DWG.REF. No.RM-06)**

**9.9. Treatment for cracks in Masonry wall.**

a. Existing plaster along the crack shall be removed on either side of the crack for a width of about 300 mm (on either side of the wall) and cleaned.

b. Mortar joints along the crack shall be deep raked and filled with cement mortar.

c. Weld-mesh of size 50 x 50 x 3 mm shall be fabricated and fixed across the crack using 'U' nails.

d. Re-plastering the region with CM 1:4 as per standard practice

**(Refer sketch DWG.REF. No.RM-12)**

### 9.10 Treatment for dampness region of masonry wall.

a. The deteriorated plaster on masonry walls shall be removed by gentle chipping.

b. The mortar joints in walls shall be deep racked and re-pointed with CM 1:4 as per the standard practice followed by re-plastering in CM 1:3 mixed with waterproofing plasticizers.

### 9.11 Treatment for chejja's.

a) The deteriorated plaster on top and bottom chejja shall be removed by gentle chipping.

b) The chejja shall be cleaned using air and water jet as per standard practice.

c) Exposed reinforcing bars shall be thoroughly cleaned with wire brush and emery cloth or by mechanical buffing wheel to remove rust, scales etc.

d) Exposed concrete surface shall be thoroughly cleaned with wire brush followed by air and water jet to remove dust particles.

e). Sacrificial zinc anode shall be provided as per standard practice and manufacturers specification.

f). Severely corroded rebars (if any) shall be replaced by same diameter rebar through welding.

g). Two coats of anti-corrosive chemical shall be provided on the exposed and cleaned reinforcing bars as per the manufacturer's specification.

g). Exposed concrete surface shall be provided with corrosion inhibitor solution using a pneumatic sprayer as per manufacturer's specification.

h). 20mm thick screed concrete shall be provided to slope over the chejja top,

i). 12mm thick( 1:4) mixed with polypropylene fibres and water proofing compound shall be provided as per standard practice.

k). 20 mm thick polymer modified mortar plaster to specification shall be provided (suitable to site condition) and finished in flush with the adjacent , with a drip mould at the edge and cured.

**(Refer sketch DWG.REF. No.RM-13)**

### 9.12 Treatment for floor slabs.

a) All loose plaster, cover concrete & patch-up regions in the RC members shall be completely removed by gentle chipping to expose hard / sound concrete surface.

b) Exposed reinforcing bars shall be thoroughly cleaned with wire brush and emery cloth or by mechanical buffing wheel to remove rust, scales etc.

c) Exposed concrete surface shall be thoroughly cleaned with wire brush followed by air and water jet to remove dust particles.

d) Sacrificial zinc anode shall be provided as per standard practice and manufacturers specification.

e) Severely corroded rebars (if any) shall be replaced by same diameter rebar through welding.

f) Two coats of anti-corrosive chemical shall be provided on the exposed and cleaned reinforcing bars as per the manufacturer's specification.

g) Exposed concrete surface shall be provided with corrosion inhibitor solution using a pneumatic sprayer as per manufacturer's specification.

h) a coat of bonding epoxy shall be provided prior to concreting as per standard practice.

i) 20 mm thick screed concrete to specification shall be provided (suitable to site condition) and finished in flush with the adjacent surface over a coat of primer as per manufacturer's specification and cured.

j) Tile/granite/marble flooring to suit the present requirement shall be carried out as per standard

Note : Based on the corrosion condition of the floor slab additionally 8mm bar @ 250c/c may be provided using shear connectors.

**(Refer sketch DWG.REF. No.RM-15)**

### 9.13 Anti-Carbonation treatment to all RC members.

Considering the corrosion environment and presence of high chloride content in RC members it is recommended to provide anti-carbonation protective coating all the RC members Tower C to protect RC members from carbonation and to enhance the life of the structure.

(This has to be carried out after completing all proposed restorations measures to RC members)

**9.14 All leaky down take pipes in the shaft/duct region shall be removed and replaced with the new ones by using PVC pipes as per standard practice ensuring leak-proof joints.**

**9.15 Adequate slope shall be provided in bed of existing drains for easy disposal of water and avoid water stagnation.**

**9.16 Groove cutting shall be made/provided in existing pavement concrete to facilitate thermal expansion. The groove shall be filled using elastomeric/water-resistant sealant/bitumen.**

**Note:** *Since the inbuilt/inherent chloride content in the concrete is excess than the permissible limit, the restoration schemes are worked out in order to* ***reduce/ minimize*** *the corrosion by providing concrete encasement to severely distressed members and polymer modified mortar treatment to locally damaged regions. Sacrificial zinc anode has been suggested to enhance the longevity of the structure.*

*Additional protective measures such as anti-carbonation coating has been proposed which acts as barrier against the corrosive environment and protects the concrete to maintain its alkalinity & rebar's from corrosion.*

*To arrest leakages, seepages and to fill cavities/honeycombs in the concrete grouting has been suggested.*

*The above recommended restoration /corrective measures is to render distress regions normal and minimize the extent of distress & to enhance the life/durability of the structure.*

## 10.0 GENERAL RECOMMENDATIONS

In addition to the above-mentioned recommended measures, the following are the general recommendations.

- The joint between ramp wall & paver block road at south face & east face shall be provided with elastomeric / water-resistant sealant/bitumen to avoid water entering adjacent to the wall.
- Corrosion activities shall be monitored in RC members periodically (i.e., at least three years once).
- Leakages/seepages/corrosion in any RC member shall be treated immediately without delay.

- Water stagnation on floor slab/drain shall be avoided.
- Periodic maintenance of the building shall be strictly adhered to for effective functioning and enhancing the life of the structure.
- Stagnation of water around the flowerpots shall be avoided by providing a plastic plate/bowl for collecting excess water.

## 11. CONCLUDING REMARKS

Based on the detailed assessment study carried out on Tower C of the existing **"CHANDERKUNJ" Army Towers of Army Welfare Housing Organisation (AWHO) Residential Apartment Building"** located at Silver Sand Island, Vytilla, Kochi, Kerala, India as it stands is found to be distressed mainly due to corrosion, minor leakages and seepages. However, the quality & strength of concrete in the tested RC members are found to be by and large satisfactory.

The extensive distress is mainly due to presence of in built/inherent high chlorides content in the concrete samples, carbonation of concrete, leakages from roof slab, Seepages from retaining wall over a period of time.

Based on analysis with and without distress of structural elements as detailed in theoretical analysis and design shear wall S1 to S36 requires strengthening, on the other hand columns, beams and slabs with degradation found to be adequate to withstand the expected loads. The strengthening of columns, beams and slabs is required in view of corrosion of rebars and strength of concrete less than designed strength. The minimum grade of concrete for strengthening of structural elements shall be M40.

Based on IRC model Service life of the structure is evaluated with degradation due to corrosion rebars and expected extended service life of structure with strengthening of distressed members are furnished. However, these functional-related distress features call for appropriate treatment to avoid further deterioration and to improve the durability and longevity of the structure.

On carrying out the recommended remedial measures effectively under the guidance of experienced technical personnel by an experienced agency, the distress in the building will be minimized.

After carrying out the recommended remedial measures effectively it is mandatory to carry out periodic maintenance of the building as per standard practice.

## REFERENCE QUALITY GRADING CHART FOR (ULTRASONIC PULSE VELOCITY TEST)

**Instrument** : PUNDIT [Portable Ultrasonic Non-Destructive Digital Indicating Tester]

**Make** : M/s. Proceq, Switzerland

**i) For Concrete (≤M25)**

| Pulse Velocity (Km/sec) | Concrete Quality Grading |
|---|---|
| Below 3.5 | Doubtful |
| 3.5 to 4.5 | Good |
| Above 4.5 | Excellent |

**ii) For Concrete (>M25)**

| Pulse Velocity (Km/sec) | Concrete Quality Grading |
|---|---|
| Below 3.75 | Doubtful |
| 3.75 to 4.50 | Good |
| Above 4.50 | Excellent |

**Note:** Concrete quality grading for different velocity criterion as reproduced from Table-1 of IS 516 (Part 5/Sec1): 2018 Clause 2.5.2 Amendment November -2019.

In case of "Doubtful quality", it may be necessary to carry out further testing.

CONCRETE QUALITY GRADING CHART FOR ULTRASONIC PULSE VELOCITY TEST
[AS PER TABLE-1 OF IS:516 (PART 5/SEC 1) : 2018 (Amendment-November 2019)]

| PULSE VELOCITY (km/sec) | CONCRETE QUALITY GRADING |
|---|---|
| Below 3.75 | Doubtful* |
| 3.75 to 4.50 | Good |
| Above 4.50 | Excellent |

* IN CASE OF "DOUBTFUL" QUALITY, IT MAY BE NECESSARY TO CARRY OUT FURTHER TESTING.

AVINASH. S
Technical Manager - NDT & Forensics

NOTES:
1. ALL DIMENSIONS ARE IN mm.
2. DO NOT SCALE THE DRAWING.
3. FOLLOW WRITTEN DIMENSIONS ONLY.
4. ALL FIGURES INDICATES VELOCITY OF PULSE IN Km/Sec.(TYP).
5. *(NS FURNISHED BY CLIENT)
6. AGE OF CONCRETE - MORE THAN 28 DAYS
7. LC-INCONSISTENT READINGS DUE TO PRESENCE OF CRACKS/VOIDS IN CONCRETE.
8. REFER SKETCH DRAWING 01 TO 05 FOR MEMBER/GRID IDENTIFICATION.

| CONCRETE QUALITY GRADING CHART FOR ULTRASONIC PULSE VELOCITY TEST [AS PER TABLE-1 OF IS:516 (PART 5/SEC 1) : 2018 (Amendment-November 2018)] | |
|---|---|
| PULSE VELOCITY (km/sec) | CONCRETE QUALITY GRADING |
| Below 3.75 | Doubtful* |
| 3.75 to 4.50 | Good |
| Above 4.50 | Excellent |

* IN CASE OF "DOUBTFUL" QUALITY, IT MAY BE NECESSARY TO CARRY OUT FURTHER TESTING.

NOTES:
1. ALL DIMENSIONS ARE IN mm.
2. DO NOT SCALE THE DRAWING.
3. FOLLOW WRITTEN DIMENSIONS ONLY.
4. (XXX) VALUES INDICATES VELOCITY OF PULSE IN Km/Sec.(TYP).
5. *(AS FURNISHED BY CLIENT)
6. AGE OF CONCRETE - MORE THAN 28 DAYS.
7. LC-INCONSISTENT READINGS DUE TO PRESENCE OF CRACKS/VOIDS IN CONCRETE.
8. REFER SKETCH DRAWING 01 TO 05 FOR MEMBER/GRID IDENTIFICATION.

PROJECT: STRUCTURAL STABILITY ASSESSMENT OF RESIDENTIAL ARMY TOWERS OF ARMY WELFARE HOUSING ORGANIZATION, KOCHI KERALA

TITLE: **UPVT RESULTS**

CONSULTANT: BUREAU VERITAS (INDIA) PVT. LTD.

DATE OF RECEIPT -27/12/2022

Date of submission – 25th April 2023

*# Refer sketch **DWG.REF.No GL/BF-01 to GL/29F/TC-30** for Floor / Member / Grid Identification.*
*+ After applying necessary correction factor for impact position of Hammer.*
**As furnished by the customer.*

***Note-1:***

The estimation of strength of concrete by rebound hammer method cannot be held to be very accurate and probable accuracy of prediction of concrete strength in a structure is ±25%. Depending upon correlation curve and methodology adopted for establishing correlation between rebound index and likely compressive strength as per clause 8.1 of IS 516 (Part5/Sec4):2000.

***Note-2:***

1. The results relate only to the sample tested.
2. Report shall not be reproduced, expect in full, without the written approval of the lab.
3. The report shall be read in line with disclaimer given at rear side of the report.
4. Any correction invalidate this report.

# REFERENCE STRENGTH CHART
# FOR REBOUND HAMMER TEST

**Test instrument** : Schmidt Hammer

**Make** : M/s. Proceq, Switzerland

**Type** : N-34

**Technical reference** : 1. IS 516 (Part 5/Sec4): 2020
2. Instrument manual furnished by M/s. Proceq, Switzerland

| REBOUND NUMBER | ESTIMATED COMPRESSIVE STRENGTH RANGE (N/Sq.mm) |
|---|---|
| 22 to 26 | 10 to 14 |
| 26 to 30 | 14 to 18 |
| 30 to 34 | 18 to 22 |
| 34 to 38 | 22 to 26 |
| 38 to 42 | 26 to 30 |
| 42 to 46 | 30 to 34 |

**Note :**

1. Estimated compressive strength is worked out based on the Calibration Chart developed for the above test instrument in our laboratory.

2. The estimation of strength of concrete by rebound hammer method cannot be held to be very accurate and probable accuracy of prediction of concrete strength in a structure is ±25%. Depending upon correlation curve and methodology adopted for establishing correlation between rebound index and likely compressive strength as per clause 8.1 of IS 516 (Part5/Sec4):2000.

## REFERENCE CHART FOR HALF CELL POTENTIAL DIFFERENCE MEASUREMENT TEST

**Test instrument** : CANIN Corrosion Analyser

**Make** : M/s. Proceq, Switzerland

**Technical reference** : IS 516 (Part 5/Sec2): 2021

| Sl. No. | Measured Potential Difference | Probability of Corrosion |
|---|---|---|
| 1. | -200mV or less negative than -200mV | **Low Probability of Corrosion** (There is a greater than 90 percent probability that no reinforcing steel corrosion is occurring in that area at the time of measurement) |
| 2. | Between (-) 200 mv to (-) 350 mv | **Uncertainty of corrosion** (Corrosion activity of the reinforcing steel in that area is uncertain) |
| 3. | < – 350 mV or more negative than – 350 mV | **High probability of corrosion** (There is a greater than 90 percent probability that reinforcing steel corrosion is occurring in that area at the time of measurement |
| 4. | < – 500 mV | **Severe probability of corrosion** |

As per Table 1: Criteria for Corrosion Condition of Rebar in Concrete Cu/CuSO4 electrode half-cell (Clauses 4 and 6.11)

Reinforced Concrete Structures

## RESULTS OF CARBONATION TEST

**Project** : Structural Stability Assessment Existing Chanderkunj Army Residential Tower-C of Army Welfare Housing Organization, Kochi, Kerala.

**Members tested** : RC Columns, Beams, Shear wall & Staircsae Waist Slab

**Date of test** : 18th January 2023 to 23rd February 2023

**Chemical used for** : **Phenolphthalein indicator** normally 1gm Phenolphthalein dissolved **Carbonation test** in 70ml Ethyl alcohol & diluted to 100 ml with distilled or Deionized water.

**Carbonation test**

**Technical reference** : IS 516 (Part-5/ Sec-3) 2021

| Sl. No. | Member Identification# | Grid Identification# | Depth of Carbonation (mm) | Stipulation |
|---|---|---|---|---|
| 1 | 2 | 3 | 4 | 5 |
| **Tower B** | | | | |
| **Basement Floor** | | | | |
| 1 | RC Beam | Mb/9b-10b | 30-40 | **Carbonation should not reach reinforcement level during life time of the structure** |
| 2 | RC Beam | Ab/9b-10b | 25-32 | |
| 3 | RC Shear Wall | Eb-Fb/2b-3b | 30-35 | |
| 4 | RC Column | Cb/1b | 40-50 | |
| 5 | RC Column | Cb/12b | 38-45 | |

## TEST REPORT ON CONCRETE CORE TEST

| | | |
|---|---|---|
| Source Of Sample | : | Sample supplied by the Customer |
| ContractNo/Proposal No | : | 17671143/IND.B.7.2022.300DR-R3 DT.25.10.2022 |
| Customers Reference | : | B/03029/SSI/job Work/CHN/AWHO Dated 30-12-2022 |
| Project# | : | Structural Stability of Chanderkunj Residential Army Towers of Army Welfare Housing Organisation (AWHO) Located at Silver Sand Island, Vyttila, Kochi Kerala |
| Members tested | : | RC Columns, RC Beams , RC Shear Walls& RC Slab |
| Date of Core Extraction | : | 15/02/2023 to 23/02/2023 |
| Date of test | : | 02.03.2023 |
| Grade of Concrete# | : | M30 |
| Reason for Testing | : | To ascertain the quality/ strength of in-situ concrete |
| Age of concrete | : | More than 28 days # |
| Capping Materials Used | : | EP10 Hardner (Part A) & EP10 Base (Part B) From M/s Fosroc Conbextra |
| Condition of Sample | : | Satisfactory |
| Test Method | : | IS: 516 Part 4: 2018 |

| Sl. No | Id# | Core length (l) (mm) ## | Core diameter (d) (mm) | Core Weight (kg)## | Max. failure load (kN) | Corrected Core comp. strength (N/sq.mm) ### | l/d Ratio | Correction factor for (l/d) ratio+ | Corrected cylinder comp. strength (N/sq.mm) | Equivalent cube strength++ (N/sq.mm) | Type of failure |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 | Tower –B 4th floor RC Beam Hb/9b-10b South Side | 110.0 | 68.0 | 0.883 | 57.0 | 16.63 | 1.618 | 0.958 | 15.93 | 19.9 | Typical Compressive Failure |
